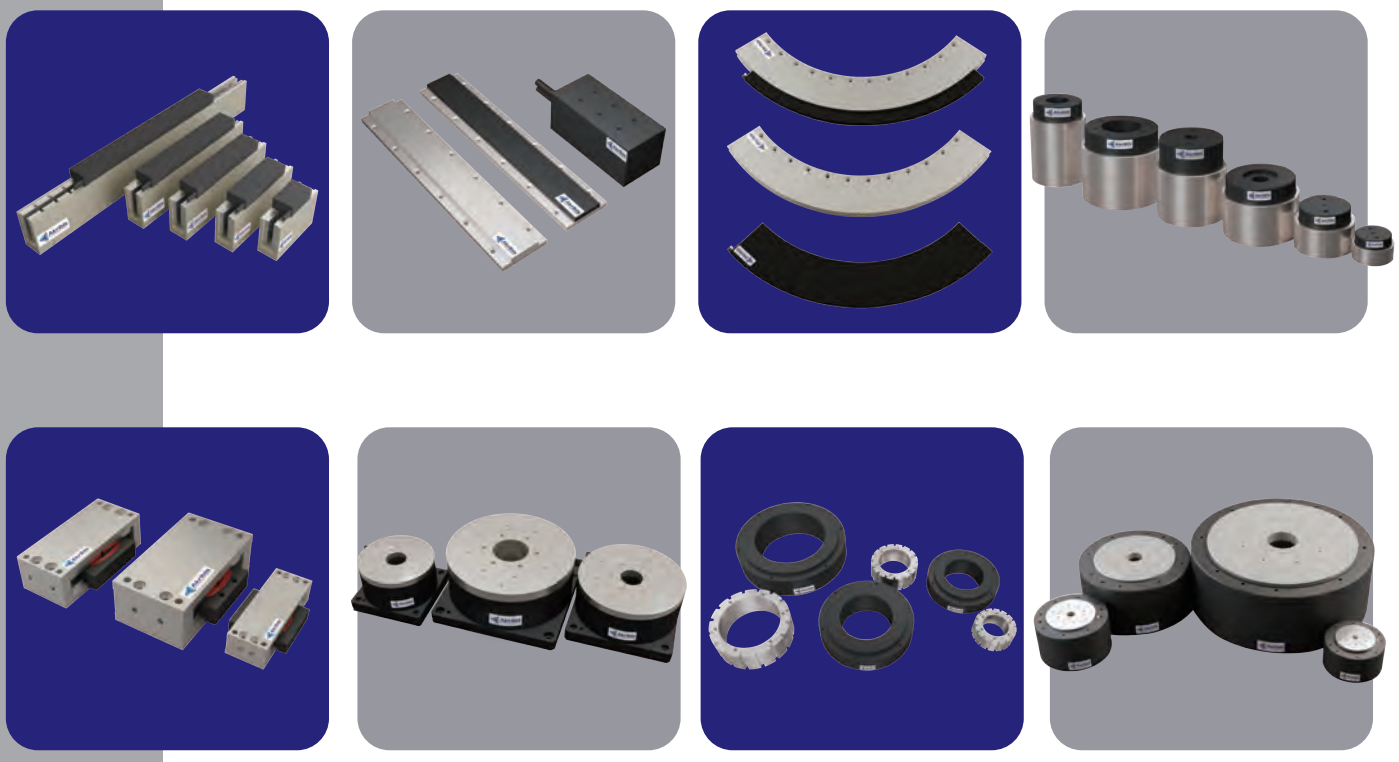
Direct Drive Motors

Linear Motors / Voice Coil Motors / Direct Drive Rotary Motors



where precision matters

EN-25.5.1

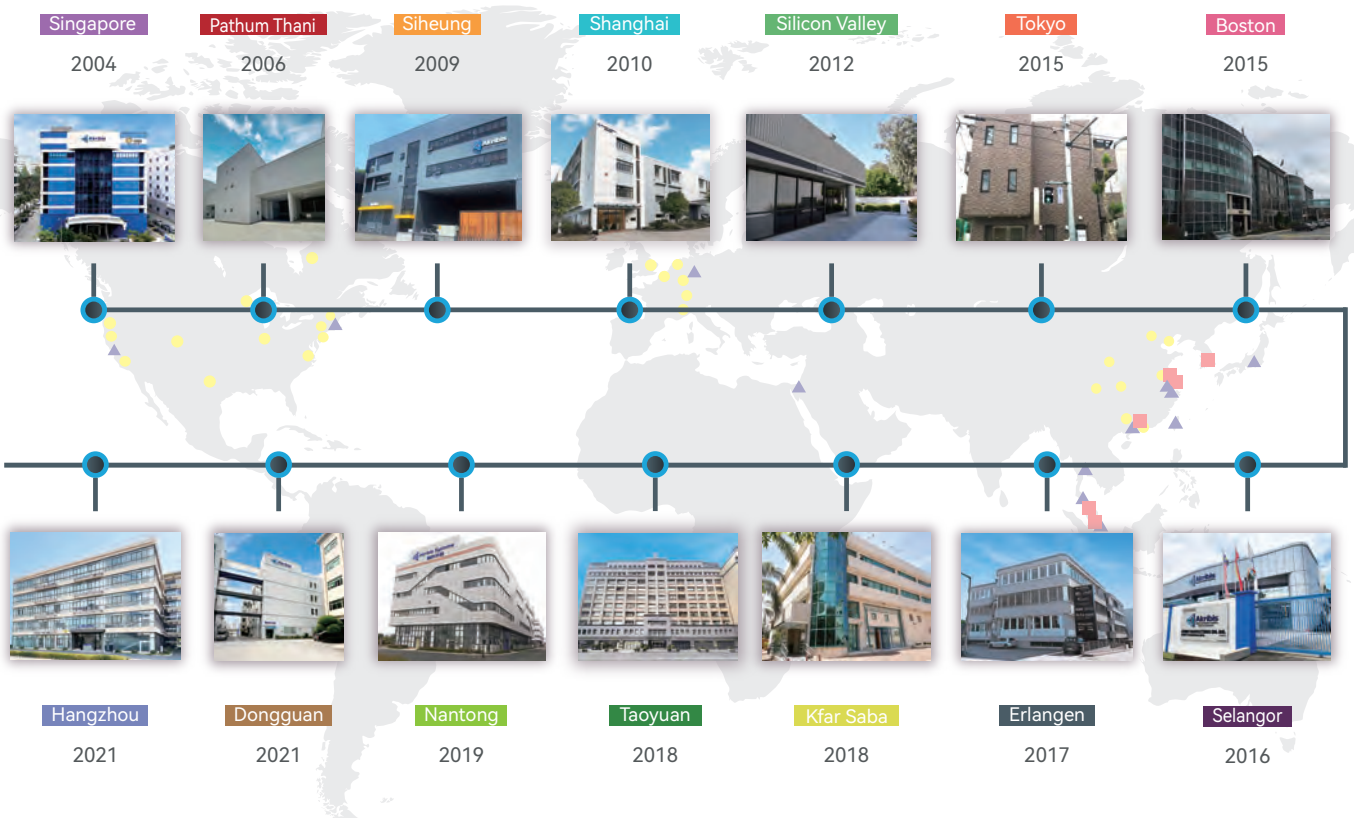
Akribis is a Latinized Greek word that means “Precision”. On the Akribis logo, the letter “a” is formed by a line and a circle, representing linear and rotary motions. These are supported by a tetrahedron structure, the same structure as the diamond crystal which has many exceptional physical properties.

The logo signifies that Akribis Systems’sound engineering expertise is the basis of the company’s foundation, and this enables us to provide customers with precise, direct drive motion control solutions.

Akribis Systems Pte Ltd was founded in 2004. We design and manufacture direct drive motors, stages and precision systems that are used in equipment for manufacturing, inspection and testing. Akribis Systems supports a wide range of industries including semiconductor, solar, flat panel, hard disk, LED, printed circuit board, printing, photonics and biomedical manufacturing.

From the beginning, the company has been focusing on innovation and development of new technologies and solutions in motion control, with more than 148 patents applied. Backed by a very strong and committed engineering team, the company continues to develop custom motors and systems for demanding applications.

We have manufacturing facilities in Singapore and in Shanghai， Nantong and Dongguan, China and in Selangor, Malaysia and in Siheung, Korea. Our sales network includes our sales offices in USA, Germany, South Korea, Japan, Thailand, Israel and Malaysia， and is reinforced by our comprehensive distribution channels in Asia, Europe and North America.



CONTENTS

Please refer to Direct Drive Stages for Akribis direct drive modules and stages.

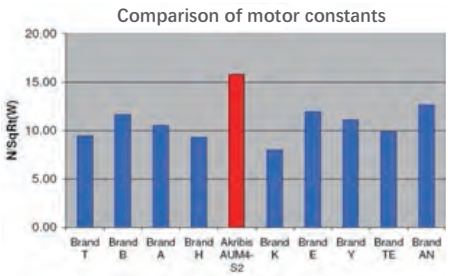
Introduction

Most Complete Range of Linear Motors

Akribis linear motors can be categorized into iron core and ironless series. Consisting of motor coils and magnet tracks, Akribis linear motors provide unparalleled advantages and features to improve system performance and efficiency: high speed, high acceleration, low velocity ripple, low operation noise, superior stability, wear & tear free, maintenance free, and long travel stroke. Akribis offers various models under each category, including: AUM, AWM, AHM, ALM-T, ACR and RDM series ironless linear motors; AJM, AQM, AKM and AKH series iron core linear motors for automation industry. AKM and AKH series iron core motor with water/oil cooling options for CNC industry.

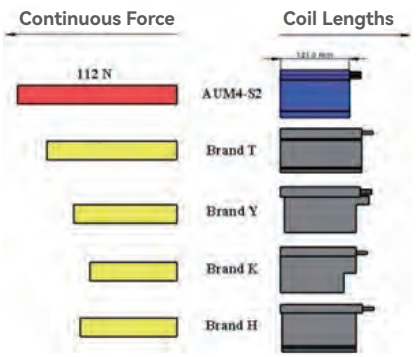
1. High motor constant

Our AUM series motors utilize our patented design to generate high amount of force possible while maintaining a compact form factor. In comparison to other motors in its class, AUM series motors exhibit high motor constant, which is a measure of efficiency of a motor and it also determines the continuous force a motor can produce.



2. Short coil lengths

Our AUM motors are capable of generating high force output even with shorter coil lengths.

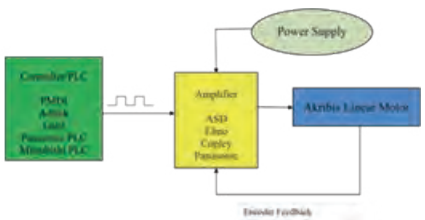


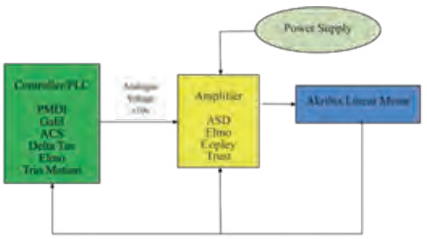
3. Custom design is possible

For applications where none of our standard linear motors fit your requirements. Akribis can offer customized designs. We design custom motors for disk drive, semiconductor front and back end, PCB and other industries. From concept design, prototyping and production, Akribis
engineers have vast experience in helping our customers achieve the performance they need at affordable costs.

4. Flexible control modes

Akribis linear motors are compatible with all well-known motion controllers and drivers.





1. Pulse and direction operating mode
2. Analog current / velocity operating mode
3. Distributed control (EtherCAT, CANopen, RS232, PROFINET)

Voice Coil Motors

Voice coil motors are short stroke actuators that utilize the electromagnetic interaction between permanent magnets and coil windings to generate thrust output. It is a direct drive motor, meaning it drives the load directly without requiring any transmission mechanism.

Akribis offers various types of voice coil motors, including AVM series cylindrical motors and AVA series planar motors.

1. Types of motion control for voice coil motors

1.1 Two postion control

A voice coil motor can be used as a simple two position actuator. Mounted with linear guidance bearings, the coil is typically moved while the core is kept stationary, although the reverse can also be done. A positive current causes the voice coil motor to move in one direction, while a negative current causes it to move in the opposite direction. At both ends, hard stops can be used to stop the motion, very much like a pneumatic actuator, except that a voice coil motor is completely powered by electricity without the need for compressed air.

A two position electronic drive, EOD from Akribis can be used to drive the voice coil motor in the manner described above. The peak current, peak current duration and holding current can be adjusted to control the start of motion and the holding force of the voice coil motor at stationary position.

1.2 Servo control

A voice coil motor can also be used as a servo motor. Other than linear bearings, a feedback device such as a linear encoder can be used for closed loop control. In this way, the acceleration, velocity and stopping position of the voice coil motor can be controlled precisely.
For example, the XMGV is a complete servo controlled voice coil module consisting of AVM voice coil motor, linear bearings and a linear encoder.

2. Advantages of using voice coil actuators

1. Low moving mass inertia
The moving coil typically has low mass inertia, enabling very high acceleration and short settling time with direct drive input.

2. Low inductance
The inductance of a voice coil motor is typically very low. Hence, the electrical time constant is very low, enabling the voice coil motor to have very fast response.

3. Smooth motion
There is no detent force in a voice coil motor. Hence, very smooth motion can be achieved, even at low speed.

4. Reliability
Since there is no contact between the coil and the core of a voice coil motor, there is no wear and tear, making the voice coil motor very reliable.

5. Force control
The force produced by a voice coil motor is linearly proportional to the current applied. This makes it suitable for force control applications.

Direct Drive Rotary Motors

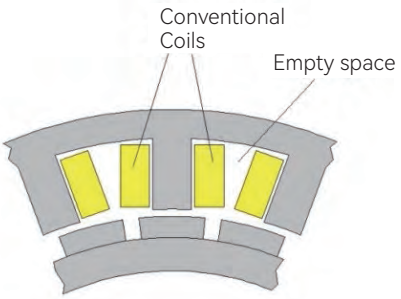
Direct drive rotary motors (DDR) are motors that are designed to drive loads directly without the need of any transmission mechanism, such as gears or belts. These motors are also called torque motors. They use high energy permanent magnets to generate high torque.

Akribis offers various types of DDRs, including ADR-A series, ADR-B series, ADR-P series, ADR-F series, ADR-T series, ACD series, ACW series and AXD series. We also design many customized direct drive motors according to specific applications.

1. ADR-A series

The ADR-A series motors are iron core type of brushless motors. Through our unique winding design, our ADR-A series motors produce very high torque, compared to other motors in the industry. The form factor of our ADR-A series motors is also smaller than competitor products. With low rotor inertia, these motors give better response and settling time. The maximum speed for our motors is also relatively higher than other motors.

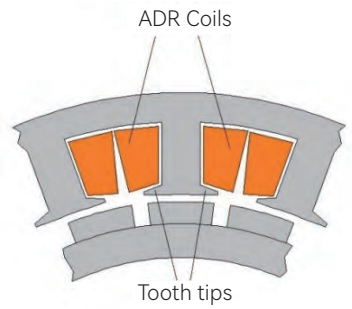
The figure on the right show the windings of a conventional DDR and our ADR-A series.



Conventional DDR

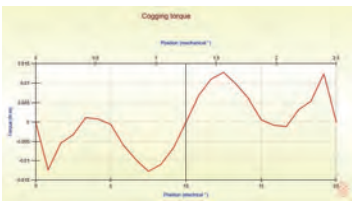
For a conventional DDR, the coils are wound and inserted into the slots, between the teeth of the stator. The coils are rectangular in shape when viewed from the top. Therefore, there is an large empty space in between the the coils. This space is wasted, since the available magnetic flux is not used to produce any torque in this region.

For the ADR-A series, the coils are wound with a special technique, and up to 35% more coils can be wound, fully utilizing the space in the slots. This results in much higher torque compared to the motor with the same form factor.



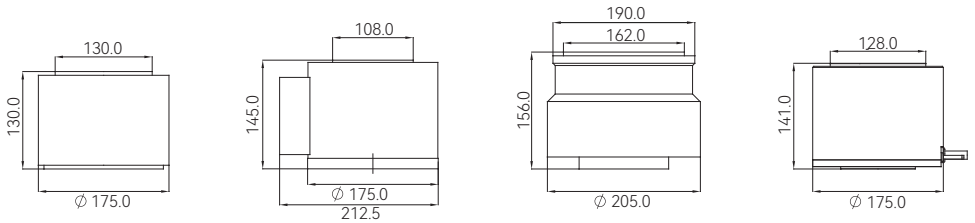
ADR-A Series

The ADR-A series also has tooth tips on the stator teeth. This design minimizes the cogging torque significantly, without compromising the motor performance. Akribis design engineers put in a lot of effort to optimize the performance of the motors, including reducing the cogging torque to a minimum level.



On the right is an example that shows the cogging torque of a motor at different positions.

Below is an illustration that compares our ADR175-A-138, to other motors with similar diameter.



Brand/Models	Unit	Brand 1	Brand 2	Brand 3	Akribis ADR175-A-138	Our Advantages
Outer Diameter	mm	175.0	175.2	190.0 (205.0)	175.0	Low Height
Motor Height	mm	130.0	145.0	156.0	141.0	Low Height
Peak Torque	Nm	42.0	32.8	30.0	98.6	Higher Peak Torque
Continuous Torque	Nm	14.0	9.8	Not published	32.9	Higher Continuous Torque
Max Speed (230VAC)	rpm	300	498	120	470	Higher Speed
Rotor Inertia	Kgm^2	0.022	0.0071	0.072	0.0076	Low Rotor Inertia

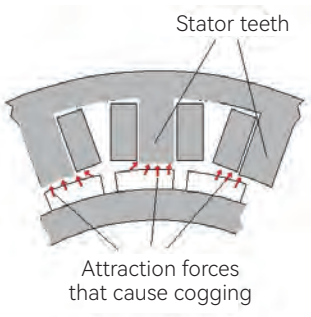
The ADR-A series motors are designed with low cogging torque. They are fully integrated with bearings and different options of encoders, such as optical encoder with digital output, and optical encoder with SINCOS. The motors also come with low and high speed windings (S or P).

2. ADR-P, ADR-F, ADR-T and ACD-P series

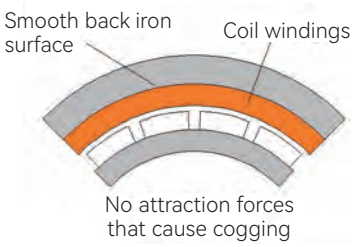
Akribis frameless torque motor ADR-P, ADR-F, ADR-T and ACD-P series consist of only rotors and stators, allowing them to be easily integrated into complex systems. ADR-P series motors are equipped with hall sensors, which easily interface with all types of servo amplifiers and controllers. ADR-F and ADR-T series motors are specifically designed for robot joint applications with low voltage and high speed requirements. The unique coil winding design yields one of the highest torque density in the market. Moreover, ADR-T series are more compact and more cost-effective.

3. ACD series

The ACD series motors are coreless type of brushless motors. These motors do not produce any cogging torque. Consequently, smooth motion can be achieved with low velocity ripple. The unique winding design also gives high torque density, although the output torque is lower than the ADR-A series motors.



Conventional iron core DDR



ACD Series

These motors are also integrated with high precision bearings, which give good radial and axial runout. High resolution optical encoders with digital output and SINCOS are available as options. The motors also come with low and high speed winding connections (D or Y).

4. ACW series

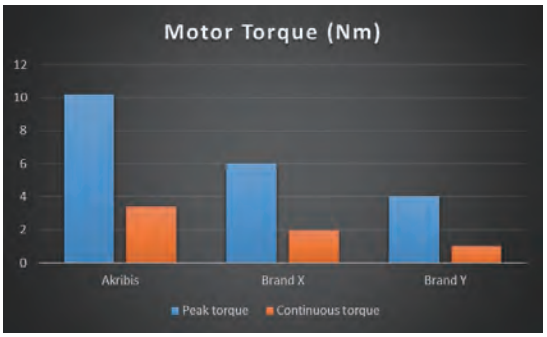
The ACW series are using coreless technology. They are designed with very low profile, and the motors do not produce any cogging torque, which allows smooth motion to be achieved with low velocity ripple.

5. AXD series

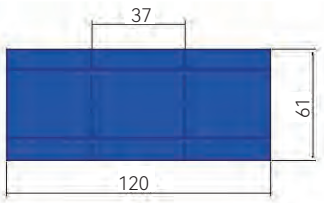
The AXD series are ironcore brushless DC motor. Being similar to ACW series, AXD series adopt flat design, featuring with large centre hole, small volume, high torque density, low moment of inertia and light in mass and combine with high resolution optical encoder with high precision.

Compact size with high torque density

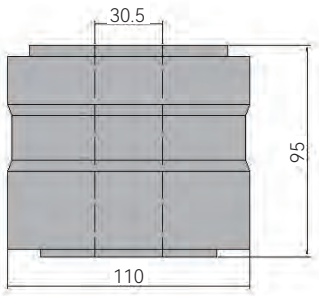
The AXD series direct drive torque motor has very high torque density. The peak torque and continuous torque are high, even though the motor form factor is relatively small. On the right is a graph that shows the comparison with 2 competitors' motors with similar size.



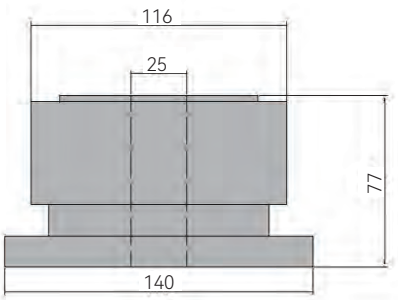
The table below compares the key specifications of AXD motor with 2 competitors' motors of similar size. AXD motors outperform their competitors in all aspects.



Akribis AXD



Brand X



Brand Y

Brand/Models	Akribis AXD 120	Brand X AX200XX	Brand Y DM1C-XXX	AXD vs Competitor
Motor height	61 mm	95 mm	77 mm	AXD is 26%~56% better
Peak torque	10.0 Nm	6 Nm	4 Nm	AXD is 70%~155% better
Continuous torque	3.4 Nm	2 Nm	1 Nm	AXD is 70%~240% better
Centre hole size	37 mm	30.5 mm	25 mm	AXD is 21%~48% better
Max speed	1400 rpm	300 rpm	150 rpm	AXD is 360%~830% better
Rotor inertia	0.00102 kg·m²	0.00575 kg·m²	0.0025 kg·m²	AXD is 145%~464% better
Motor mass	2.7 Kg	4.7 kg	3 Kg	AXD is 11%~74% better
Repeatability	± 3 arcsec	± 5 arcsec	±3 arcsec	AXD is 66% better

Low rotor inertia

In the torque equation T = Jα (where T is torque, J is moment of inertia, α is angular acceleration), much higher acceleration can be achieved if the moment of inertia is smaller. The moment of inertia used in the computation actually comprises 2 parts: the moment of inertia of the motor, and the moment of inertia of the load.

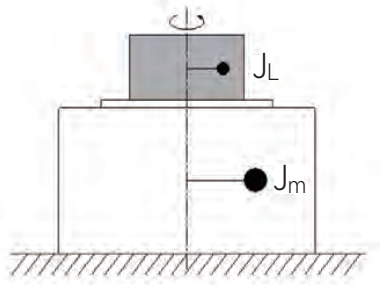


Illustration of motor inertia and load inertia

J = Jm + JL

where

Jm: Motor's rotor inertia

JL: Load inertia

In many cases, the moment of inertia of the motor actually contributes a large percentage of the total moment of inertia. This means that the motor torque is used mainly to rotate itself. Little torque is left for the load moment of inertia.

The rotor inertia of AXD is small. This means that more torque can be used to rotate the load, resulting in a more dynamic performance. Higher acceleration and shorter settling time can be achieved.

Low overall mass

The overall mass of an AXD motor is also smaller, compared to competitor's motors with similar size. Newton's second law (F = ma) tells us that for higher acceleration, either the force has to be larger or the mass has to be smaller.

The trend for the automotive industry is to make cars with lower body mass. Instead of using only steel, aluminum and carbon fiber are used to reinforce the car structure, to reduce mass. This results in better performance and higher fuel efficiency.

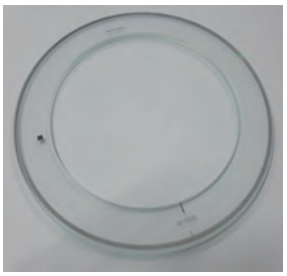
Similarly, for motors used in motion control, lower motor mass is an advantage, especially when you need to mount the torque motor on a XY table. The dynamics of the XY table is affected by how much load it has to carry. Lower applied force and higher accelerations can be achieved with lower moving mass.

Torque motor on a linear motor stage

High resolution optical encoder

The AXD torque motor uses a high resolution optical encoder for feedback. Optical encoders provide much better accuracy, repeatability and higher resolution, compared to resolvers.
The working principle of resolvers is based on rotating transformers. Other than the signal processing errors by converters, the inconsistencies in the construction of the windings affect the accuracy of the resolver.
For optical encoders, the divisions on the disk are etched with photographic and semiconductor techniques. The gratings can be made with fine pitch, such as 4, 20, 40 or 80 microns. This results in much higher accuracy.

Resolver construction



Encoder grafting

Large center hole

AXD torque motors are designed with a large center hole. The center hole is sometimes needed for optics design, wiring or pneumatic/vacuum tubing.

Higher speed

AXD torque motors are designed for higher speeds. This means that even for indexing motions, the AXD can perform the motion in a shorter time, compared to a motor with limited maximum speed.

Stages & Systems

The Akribis precision linear motor driven stage features the patented AUM series ironless linear motor in a neat, ready to use solution. Being directly driven, the linear motor stage eliminates intermediate transmission mechanism which translates directly into many benefits, including

Fast response in the form of faster acceleration (up to 25G) and settling time, which increase the throughput

High speed up to 5m/s result in shorter cycle time.

High stiffness as no mechanical transmission such as gears, belt, ball-screw, etc., are required. The driving force is directly coupled to the load.

High precision by using direct measurement systems. Distance/angle conversion is not needed.

Zero backlash as a result of direct coupling of the driving force to the load.

The structural frame of the linear motor stage is extruded aluminum, offering good structural strength and cost effective. These stages can be constructed in single piece up to 3 metres without the need for joining.

The geometrical accuracy of the stage is achieved with the use of a preloaded dual-rails-quad-runner blocks or single-rail-dual-runner blocks re-circulating linear motion ball bearing system. The runner blocks are preloaded for better stiffness, and only the ball cage types are selected to deliver a smooth and low noise motion.

The displacement accuracy is achieved with the use of a direct measurement system, consisting of a linear scale (with scale linearity controlled at +/- 3 micron/metre) and a linear encoder. The electrical resolution can achieve sub-micron level accuracy.

Thanks to the wide range of sizes, force ranges and travel strokes, linear motor modules find application in a variety of fields as per below:

Pick and place
Laser marking / machining / spot welding
Dispensing
Inspection
Printing

Sizing Guide

Linear Motor Sizing Guide

1. Sizing of a linear motor includes calculating the peak force and Root-Mean-Square (RMS) force requirement.

2. Peak force is determined by the moving mass and maximum acceleration required.

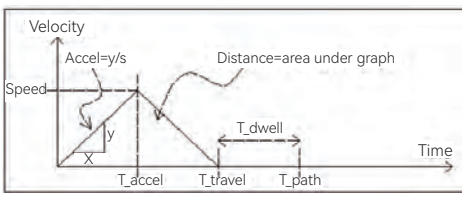
Force = Mass * Acceleration + Friction Force + External Opposing Force

For example, if moving mass is 2.5kg (including coil assembly) and required acceleration is 30m/s^2, the motor needs to exert a force of 2.5 x 30 =75N. This is assuming Friction and Opposing Forces are negligible.

3. Very often, we do not know the actual required acceleration, but we have the motion time requirement. We can calculate the required acceleration if we know the travel distance and the travel time. Usually for short travel distance application, a Triangle-Shape Velocity Profile is used whereas for long travel distances, it is more efficient to use Trapezoidal-Shape Velocity Profile. In a Triangle profile, the motor does not cruise at any velocity.

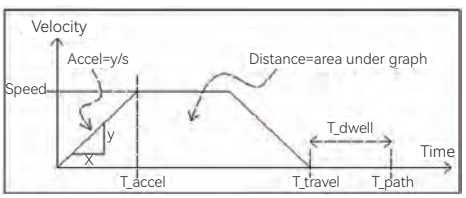
4. For Triangle Profile:

Acceleration = 4 * Distance / Travel Time^2



5. For Trapezoidal Profile, a desired cruising speed will help to determine the required acceleration.

Acceleration = Cruise Speed / (Travel Time - Distance / Cruise Speed)



6. Basically, the calculation of the deceleration is similar to the acceleration, unless there is an unbalanced force (E.g. gravitational force) acting on the motor.

7. Force required by the motor during cruising (against friction and opposing forces) and dwelling (against opposing force) may also be calculated.

Note: In order to maintain a constant speed, the motor will resist friction and external force. When the motor is stationary and enabled by a driver, it will resist the external force.

8. Compute the RMS force using the formula below.

$$F_{cont} = \sqrt{\frac{F_a^2 \cdot t_a + F_c^2 \cdot t_c + F_d^2 \cdot t_d + F_w^2 \cdot t_w}{t_a + t_c + t_d + t_w}}$$

F_{cont} = Continuous Force

F_a = Acceleration Force t_a = Acceleration Time
F_c = Cruise Force t_c = Cruise Time
F_d = Deceleration Force t_d = Deceleration Time
F_w = Dwell Force t_w = Dwell Time

9. Select a motor according to the computed peak force and RMS force requirement. User should factor in a safety factor of at least 20-30% especially when the friction and external opposing forces are assumed to be zero.

10. For example, an application requires the motor to move a 4kg load for 0.3m in 0.2s using Triangle Profile. The motor will dwell 0.15s before moving the same cycle again. Assume friction is negllgible and no presence of any unbalanced force.

Acceleration = Deceleration = 4 * 0.3 / $(0.2)^2$ = 30m/s^2

Peak Force = Fa = Fd = mass * acceleration = 4 * 30 = 120N

$$F_{cont} = \sqrt{\frac{(120)^2 \cdot (0.1) + (120)^2 \cdot (0.1)}{0.1 + 0.1 + 0.15}} = 90.7\text{N}$$

Giving an additional 30% safety factor, a suitable motor will be AUM3-S4.

11. Motor selection software is available to automate the calculation process.
Please contact cust-service@akribis-sys.com for the software.

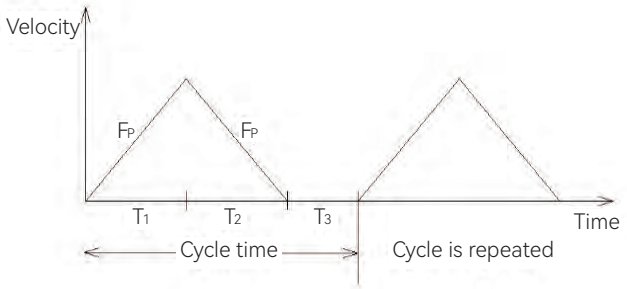
Voice Coil Motors

1. Peak force

In an application, it is important to determine the peak force and RMS force required. In order to select the right voice coil motor, the peak force is calculated by Newton's second law, F = ma. With a known moving mass, and the acceleration required for the motion profile, we can calculate the peak force required.

For example, with a moving mass of 100g, and an acceleration of 40m/s^2 , the peak force required during acceleration will be 4N.

2. RMS force



The RMS force is calculated with the equation:

$$F_{cont} = \sqrt{\frac{F_p^2 \cdot t_1 + F_p^2 \cdot t_2}{t_1 + t_2 + t_3}}$$

where

F_{cont} = Continuous Force

F_p = Peak Force

t_1 = Acceleration Time

t_2 = Deceleration Time

t_3 = Dwell Time

Using the example described above, if the stroke is 4 mm and if the time to complete motion is 0.02s, then the velocity will be 400mm/s, with an acceleration of 40m/s^2. The peak force will be 4N. If the dwell time is 0.05s. then

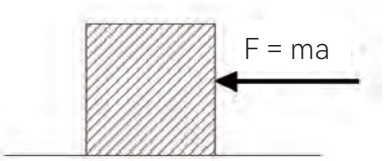
$$F_{cont} = \sqrt{\frac{F_p^2 \cdot t_1 + F_p^2 \cdot t_2}{t_1 + t_2 + t_3}} = \sqrt{\frac{4^2 \cdot 0.01 + 4^2 \cdot 0.01}{0.01 + 0.01 + 0.05}} = 2.14\text{N}$$

Hence, we can select a voice coil motor with a peak force that exceeds 4N and with a continuous force that exceeds 2.14N.

Direct Drive Rotary Motors

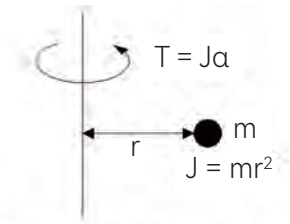
1. Peak torque and continuous torque

The torque ratings of a DDR motor must meet the torque requirements of the application. In other words, the peak torque and continuous torque of the motor must be higher than the peak torque and RMS (root mean square) torque of the application. Otherwise, the motor will not be able to accelerate as fast as needed, or the motor will over heat after some time.



Linear motion

For linear motion, by Newton's second law, F = ma, where F is the force needed to move an object in N, m is the moving mass in Kg, a is the acceleration in m/s^2.



Rotary motion

Similarly, for rotary motion, T = Jα, where T is the torque needed to rotate an object in Nm, J is the moment of inertia in Kgm^2, and α is the angular acceleration, in radians/s^2.

For an application, we can compute the peak torque and RMS torque required:

Peak torque during acceleration/deceleration, T=Jα

$$T_{\text{cont}} = \sqrt{\frac{T_a^2 \cdot t_a + T_c^2 \cdot t_c + T_d^2 \cdot t_d + T_w^2 \cdot t_w}{t_a + t_c + t_d + t_w}}$$

T_a = Acceleration Torque
T_c = Cruise Torque
T_d = Deceleration Torque
T_w = Dwell Torque

t_a = Acceleration Time
t_c = Cruise Time
t_d = Deceleration Time
t_w = Dwell Time

A motor should be selected based on the computed peak torque and RMS torque required. A safety factor of 20–30% may be used, especially if friction and external opposing torque are assumed to be zero in the calculation.

Akribis provides motor selection software, where the peak torque and RMS torque are computed automatically, and a motor is recommended after you key in the application parameters.

Akribis DDR motors are designed with very high torque density, providing higher peak torque and continuous torque compared to conventional motors design.

Akribis DDR motors are designed with very high torque density, providing higher peak torque and continuous torque compared to conventional motors design.

2. Motor inertia – the smaller the better

In the torque equation, T= Jα, much higher acceleration can be achieved if the moment of inertia is smaller. The moment of inertia used in the computation actually comprises 2 parts: the moment of inertia of the motor and the moment of inertia of the load.

In many cases, the moment of inertia of the motor actually contributes a large percentage of the total moment of inertia. This means that the motor torque is used mainly to rotate itself. Little torque is left for the moment of inertia of the load.

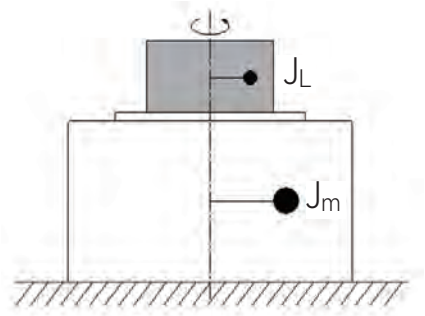


Illustration of motor inertia and load inertia

This often creates a dilemma for design engineers. The objective is to achieve a higher target performance, with higher acceleration, to reduce cycle time. Hence, higher torque is needed. In order to get higher torque, engineers need to select bigger motors with higher torque ratings. However, the bigger motor also comes with a larger motor inertia, and this result in higher torque is needed. The bigger motor may not meet the objective of achieving higher target performance after all.

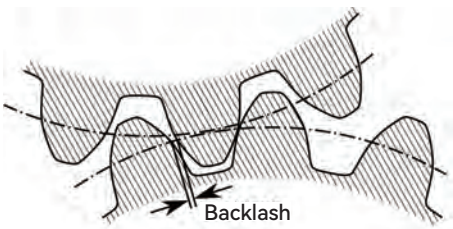
Therefore, a DDR motor with a smaller moment of inertia is an advantage. It should be noted that DDR motors with an outer rotor design will naturally have much higher moment of inertia.

Akribis ADR-A series motors are designed with optimal moment of inertia. The torque density to motor inertia ratio is excellent.

3. Does the moment of inertia of the motor have to match the moment of inertia of the load?

When using conventional servo motors with mechanical transmission systems, it is a common practice to match the motor inertia to the load inertia. Ratios of 1:5, or up to 1:10 are used. For DDR motors, it is not necessary to match the motor inertia to the load inertia.

In conventional servo motor applications, mechanical transmissions such as belts, pulleys, rack and pinion etc introduce backlash. Hence, during very small rapid motions when reversing direction of motion, the load may be decoupled from the motor for a short period of time. This creates instability in the control system. Inertia matching is used to solve this problem, so that the controller can operate in a stable manner.

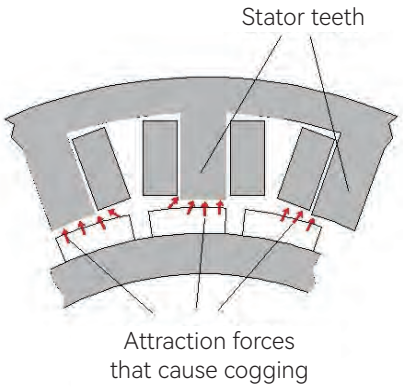


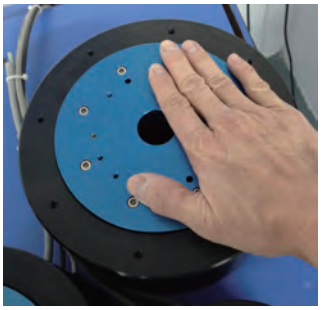
In a DDR application, the load is directly coupled to the motor without any transmission device, so there is no backlash. Consequently, there is no need for inertia matching.

4. Cogging or detent torque

DDR motors with teeth on the iron core laminations will have a cogging effect. The figure below illustrates cogging torque caused by the attraction force between the stator teeth and the magnets.

Cogging torque can be felt when you try to rotate a motor with your hand. You will feel some opposing force at certain positions.





Rotate motor by hand to feel cogging effect

The disadvantage of cogging torque is that it causes torque ripple during motion, which causes velocity ripple as well. Motion controllers can compensate the effect to a certain extent, but for slow speed applications where constant velocity is required, the effect of cogging will be detrimental.

Another disadvantage of cogging is that it affects motion settling performance, and jittering at target position.

Akribis ADR motor is designed with minimal cogging torque, due to the optimized slot/pole configuration, and the introduction of tooth tips in the stator laminations. The maximum cogging torque, peak to peak is published in our data specifications.

The ACD and ACW series motors are using coreless design, which means that they do not have any cogging torque.

5. Maximum speed

In fast motion application, the speed of the motor can be very high. Therefore, it is important to consider the type of windings required for the application, and ensure that the bus voltage from the amplifier is sufficient to overcome the back EMF voltage.

To put it simply, the bus voltage should be greater than the sum of the voltage generated by the back EMF, and the peak current multiplied by the terminal resistance of the motor:

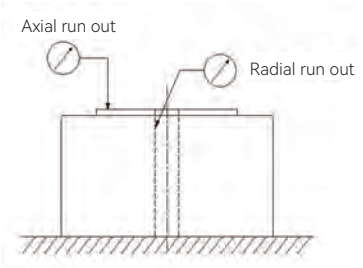
$$U_{bus(dc)} > \sqrt{6}\sqrt{\left(\frac{K_e \cdot n_{max}}{\sqrt{6}} + \frac{i \cdot R_{hot}}{2}\right)^2 + \left(\frac{\pi \cdot i \cdot L \cdot p \cdot n_{max}}{120000}\right)^2}$$

Symbol	Definition	Unit
$U_{bus(dc)}$	DC bus voltage	Vdc
K_e	Back EMF constant (line, peak value)	Vpeak/rpm
n_{max}	Max. angular speed	rpm
i	Peak current (rms value)	Arms
R_{hot}	Resistance (@working temperature, line)	Ω
L	Inductance (line)	mH

6. Axial and radial run out

The axial and radial run out of a DDR motor is determined by the precision of the bearing used, precision of the machined components and the assembly of the components. The axial and radial run out need to be considered for applications that require higher accuracy.

The axial and radial run out specifications of Akribis DDR motors are shown in the specifications sheet. Standard motors come with normal axial and radial run out values, while higher grade options are available for selection with precision level up to 5μm.



7. Feedback

Akribis DDR motors typically use optical incremental encoders for feedback. However, other options are available, such as resolvers, absolute encoders and inductive encoders. Optical incremental encoders offer better accuracy and higher resolution compared to resolvers.

All Akribis direct drive rotary motors are equipped with optical encoders. With higher encoder resolution after interpolation, Akribis rotary motors can satisfy your need of precision in any type of demanding applications.

For example, Akribis ADR135 motors are equipped with circular optical encoder scale. With 400X interpolation digital output, the motor can achieve 1202000 counts per revolution. With SINCOS (analog) output and 4096X interpolation rate from servo drive, the motor can achieve 12308480 counts per revolution.

Stages & Systems

1. Accuracy, repeatability and resolution

There are many ways to define the three confusing terms for accuracy, repeatability and resolution. Professor Slocum of Massachusetts Institute of Technology in his book "Precision Machine Design" [1], defines them in a very interesting manner namely:
"Accuracy is the ability to tell the truth"
"Repeatability is the ability to tell the same story over and over again"
"Resolution is how detailed your story is"
[1] A.H. Slocum. Precision Machine Design. Prentice Hall, Englewood Cliffs, New Jersey, 1992.

Typically, a servo positioning system consists of the mechanics (Main structural element and bearing guidance), power system (Motor and electronic components), feedback device and the controller. In short, accuracy has a dual meaning for a positioning system, namely:

Accuracy of the motion is contributed mainly by the bearings and it is the lateral deviation from the ideal motion path or the straight-line accuracy or parallelism of motion accuracy.

Accuracy is the ability of the servo system to reach the target position in which determined by the maximum error between any two points (The target position point and the actual target point) fall within the specified positioning system tolerance.

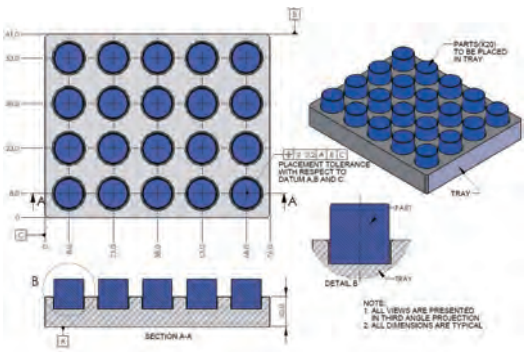
Like accuracy, repeatability has a dual meaning for a positioning system,namely:

Repeatability of the motion is the ability of the bearing to repeat its motion. For linear motion bearings, this is often referred to as the straight-line repeatability or repeatability parallelism of motion.

Repeatability is the ability of the servo system to reach the same position in which determined by the error when moving the load to the same position for multiple attempts within the specified positioning system tolerance.

Resolution in a position system currently is determined by the ability of the bearing to allow for a small increment of motion. It is the smallest mechanical step that the positioning system is capable of making during point to point motion. In other words, it will be meaningless to put an encoder with nanometer resolution on a positioning system with contact type bearing and hoping to achieve nanometer accuracy level for mechanical resolution. For contact type of bearings, 0.1 micron is by far the best achievable results.

The three terms are best illustrated with a pick and place example below. The objective is to place the cylinder into a tray as shown on the right.
The specifications indicate that we have to place the cylinder such that the centre of the cylinder is accurate to within a diameter of 0.2 millimetre, with respect to the three datums marked A, B and C.



In order to meet the specification, it is important that we select a position system with adequate resolution to achieve the require repeatability. The Table below shows a typical example on deciding the positioning resolution.

Description	Value
Tolerance (+/- 3 sigma)	= 0.2 mm
Required repeatability	= 0.2 mm/6 = 0.033 mm
Required resolution	= 0.033 mm/10 = 0.003 mm

Therefore, we should use an encoder with at least 3 microns resolution.

Now, if we successfully move the cylinder instead to the same position, we can note down the actual position ot the cylinder's centre via an independent measurement system. The centre of the cylinder can be plotted as in Figure 2 on the right.

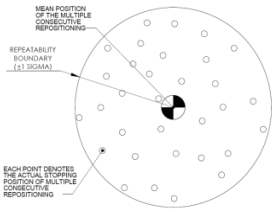


Figure 2: Actual stopping position of cylinder centre

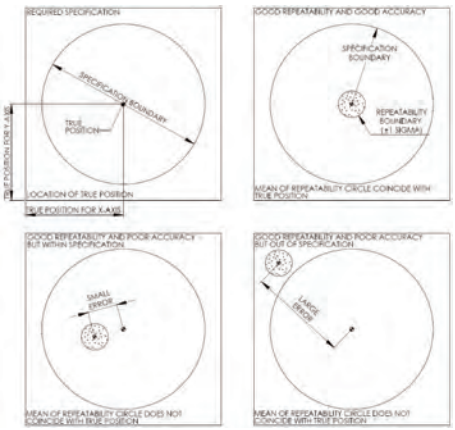

Figure 3: Specifications, Accuracy and Repeatability

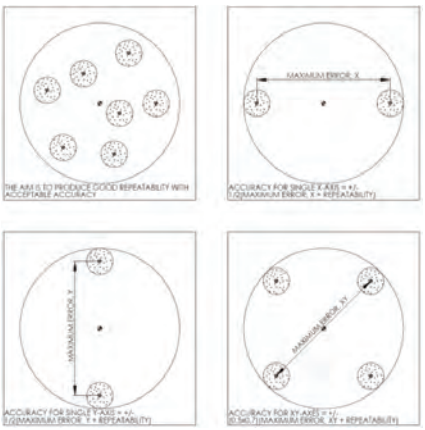

Figure 4: The aim is to produce good repeatability with acceptable accuracy

The mean position of the consecutive repositioning is marked by the centre of a circle which enclose all the points. The boundary of the big circle is the repeatability of the positioning system. Now if we superimpose the repeatability circle onto the given specifications as shown in Figure 3. In positioning system, it is much easier to achieve good repeatability than good accuracy. In many cases, the positioning is not required to be very accurate, repeatable positioning systems are capable to positioning within the required specifications given the proper positioning resolution as shown in Figure 4. It is economical to build a system which is repeatable and correct the accuracy using calibration and error compensation in the controller.

2. The relationship between force and speed

To relate the terms force and speed, let's take a look at the 7 common terms in physics when dealing with positioning systems, namely:

Description	Units	Symbol
Force	N	F
Load or mass	kg	m
Time	s	t
Acceleration	m/s^2	a
Velocity	m/s	v
Displacement	m	s
Torque	Nm	W
Power	Nm/s, Watt	P

This equation is known as the equation of motion and it gives the instantaneous value of the acceleration corresponding to the instantaneous values of the forces that are acting.

If an object starts moving from rest, its initial velocity is zero, the relationship between velocity and acceleration is given by the equation, $v = at$

Likewise, the relationship between displacement, velocity and acceleration is given by equation, $s = ½ at^2$

When force is applied to an object or load and displaced (moved) it over a distance, the work done by the force during the displacement is related by the equation, $W = Fs$

When time comes into the equation, we have power which is the rate of doing work and it is related to velocity by the equation, $P = Fv$

Now, let's relate all these terms back to positioning systems. The objective of a positioning system is to position a tool (which is the load) with respect to a workpiece. We are always concerned over how fast (which is related to time) we can perform this task of moving (which is displacement) the tool to the workpiece (which is the work to be done). To do this work, there are many types of motors available.

The capacity of a motor is measured by the rate in which it can do work or deliver energy. The total work done or energy output is not a standard measurement of the motor capacity. A motor no matter how big or small can deliver a large amount of energy if given sufficient time. On the other hand, a large and powerful motor can deliver a large amount of energy in a short period of time. In other words, if we want to travel from one point to another, we can reach that place travelling either in a small car or a big car. The only different is how long to reach the place when the same route is used. Similarly, a sport car can reach a speed of 100km/h in 5 seconds and within a very short distance. A family car can also reach 100km/h, but maybe in 12 seconds and need a longer distance. The different is in the capacity of the engine which can produce more power to accelerate the mass of the car in a very short time, thus over a very short distance.

Given the same load and travel distance, a bigger motor will be able to accelerate its load in a shorter time and at a higher velocity when compared to a smaller motor.

Motors Drive and Control Solutions Recommendation

Akribis CASD		AC/DC power supply Pulse, velocity simulation or current mode EtherCAT
Agito AGM800		Real-time synchronized control for up to 8 axes with 61 μs servo sampling time. 16kHz servo sampling rate, less than 8ns synchronization jitter.
Agito AGD155 / AGD101		AC/DC power supply EtherCAT 16kHz servo sampling rate
Agito AGD301		High performance 3-axis centralized motion servo driver, up to 90Vdc, 9Arms continuous current per axis. 16kHz servo sampling rate, ideal for highly coordinated applications.
Akribis SASD		DC power supply The smallest size is 56×53×32mm (Greater power density). High EMC performance, compliant with medical industry requirements.
Mitsubishi MR-J4 / MR-J5		AC power supply Pulse, SSCNETIII/H network mode/EtherCAT Power rating up to 22KW
Panasonic A5L / A6L		AC/DC power supply Pulse, velocity simulation or current mode/EtherCAT
Copley Xenus / Plus / Accelnet		AC/DC power supply Pulse, velocity simulation or current mode/EtherCAT
Trust Automation TA115 / TA310 / TA330		Linear amplifier Velocity simulation or current mode Low current ripple
ACS CMhp/xa		AC power supply Driver and multi-axis controller integrated Optional configuration Excellent servo performance
ACS SPiiPlusEC		Programmable motion controller EtherCAT network control Maximum support 64 axes Special motion trajectory planning function
ACS UDMmc		Maximum support 4 axes, 20A current PWM output 12V-80VDC input Support voice coil motors, brushless motors, and stepper motors Collaborate with ACS network controller

Linear Encoder Product Recommendation

Akribis ABA50 / ABA20		Absolute encoder Support Biss-C, Endat2.2 optional Resolution from 50nm
Akribis ABI51 / ABI52 / ABI54		Optical incremental encoder Optional resolution of 0.1μm, 0.05μm, SINCOS Wide alignment tolerance
Akribis NBA2000		True Dual-Track Absolute Magnetic Grating Encoder Support serial communication protocols: BISS-C, SSI, Tamagawa, Panasonic, RS-485, etc. Resolution up to 0.1μm
Renishaw RGH / ATOM / Quantic		Metal / glass / stainless steel encoder scales Resolution from 10μm to 1nm

Questions and Answers

1. What is the maximum payload that the motor can drive?

From Newton's law F = ma, the force applied is proportional to mass and acceleration. Hence, as long as the force can overcome fiction force, a heavy mass can be moved with relatively small force except that the acceleration of this mass will be small. For example, a AUM 2-S2 motor with peak force of 88N can move a 10Kg load with maximum acceleration of 8.8m/s^2 when moving horizontally.

2. How about the maximum payload in vertical orientaiton?

In vertical movements, the motor needs to overcome gravity in addition to providing force for upward vertical motion (F = mg + ma). In this case, the maximum load is determined by the maximum force divided by 9.81m/s^2. If the vertical force has to be sustained continuously, the maximum load will be the continuous force of the motor. For example, the maximum vertical load for AUM2-S2 motor will be 2.2Kg, since the continuous force for this motor is 22N. If the load is supported by a counterbalance (such as a spring), then the AUM2-S2 motor can move a heavier load in a vertical position.

3. What is the maximum speed of a motor or module?

There is no theoretical limit for the speed of a linear motor because there is no contact. However, the speed is typically limited by the mechanical bearings. For example, for linear guidance system using rails and runner blocks, the maximum speed is typically limited to 5m/s. This is why in most applications, the speed for linear motors is limited to 5m/s. An option of using ceramic ball bearings allow speeds of up to 10m/s. Using air bearings also enable higher speeds to be possible.

4. How about the maximum acceleration?

For acceleration, as explained by Newton's law (F = ma), it is dependent on the maximum force (peak force) of the motor as well as the mass to be moved.

5. What is the maximum length that a linear motor can reach?

There is no length limitation for AUM, ALM and AKM linear motors as both their motor tracks and the linear rails can be extended by joining sections together. Additionally, the linear scale for encoder feedback is available in long lengths enabling motor setups of 20 meters or more. In contrast, RDM rod motor uses a single piece magnet track enclosed by end caps which prevents track extension. Therefore, the required length must be defined during design phase.

6. What happens to a linear motor when power is cut off suddenly?

In the event of a sudden power failure, the linear motor will continue to move forward due to inertia until it collides with the end or stops due to friction. Usually, this is not a problem, but there may be safety concerns in some applications.

In general, a braking device can be installed to activate when the power is cut off, so that the motor can stop immediately. This type of braking device is usually mounted on the guide rail of a linear guide system.

7. Is linear motor suitable for clean room applications?

Yes, linear motors can be used in clean room environement. In fact, many front-end semiconductor applications have been using linear motors. For example, in wafer fabrication plants, high precision lithography machines use linear motors for very high precision XY position stage, with nanometer resolutions and sub-micron accuracy, in clean room class 10 facilities.

With linear motor gaining popularity in more applications, linear motors are now also used in other applications, such as semiconductor back end packaging, testing, pick and place, hard disk assembly and testing etc. Such applications are also being applied in a clean room environment.

The advantages of linear motor over traditional ball screw drives in clean room environment are:

- No contact in the drive actuator. Hence there is no wear and tear which causes particle generation
- No lubricant needed on the linear motor. Lubricants are a source of contamination

8. What is the effect of magnetic field from linear motors?

In some applications, there may be concerns about magnetic fields from linear motors affecting sensitive components. For such cases, ironless linear motors like AUM or ALM series are recommended as their closed magnetic circuit ensures the magnetic field outside the magnet track is negligible. In contrast, iron core linear motors (like AKM) and rod motor (RDM) do emit magnetic field within approximately 50-60mm of the magnet track. However, this field decays as the distance increases and remain constant and does not generate any RFI.

9.Ferrite bead

Ferrite beads (FB) are connected to the terminals of electric motors to filter the voltage spikes from the motor driver. Voltage spikes will cause insulation failure of electric motors. When the output voltage of the driver is not stable, the ferrite bead can protect the motor from being damaged by the voltage spikes.
In addition to ferrite beads, Akribis provides high quality cables with shielding layer and motor driver with high SNR (signal-noise ratio) to guarantee the high-performance of the motors.

10.Hall sensor

Hall sensors use the Hall Effect to output voltage signal indicating the position information of the motor mover. The motor driver can implement commutation of the motor based on this information. The combination of Hall sensor and high-resolution encoder can improve the accuracy of commutation. Akribis provides professional solutions of encoder commutation.

LINEAR MOTORS

LINEAR MOTORS

Overview

Akribis linear motors can be categorized into iron core and ironless series. Consisting of motor coils and magnet tracks, Akribis linear motors provide unparalleled advantages and features to improve system performance and efficiency: high speed, high acceleration, low velocity ripple, low operation noise, superior stability, wear & tear free, maintenance free and long travel stroke. Akribis offers various sizes and types of linear motors with force range from 3N to 16000N, as well as different cooling options like natural convection, air cooling and water cooling.

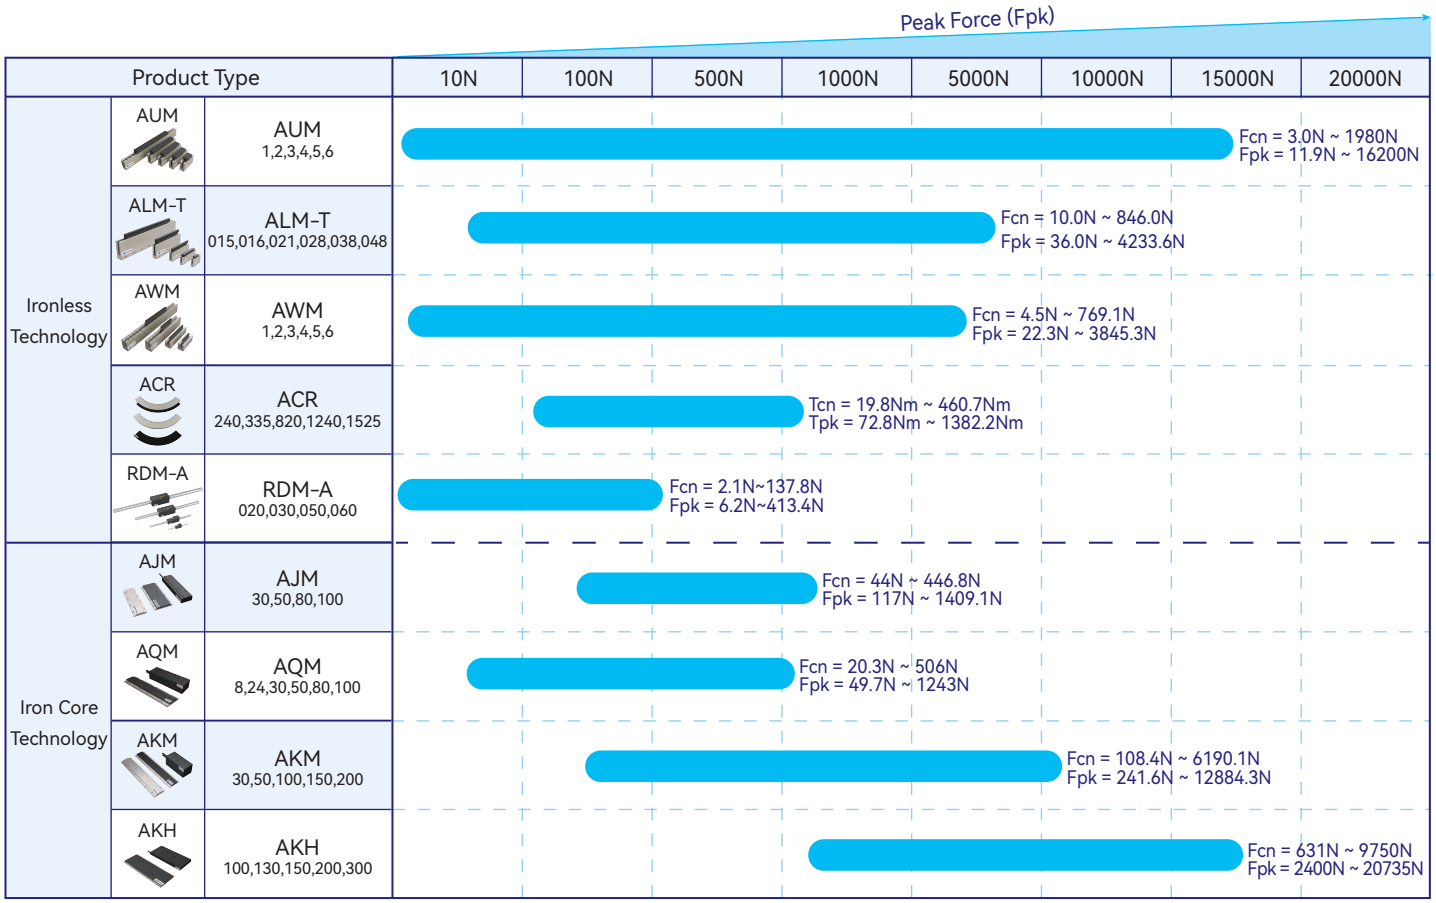
Ironless Technology

 AUM Series	• High force and stiffness • High motor constant • Efficiency • Low energy consumption	▶Applicable to: • Point-to-point micron/nanometer level positioning • High/low speed applications with demanding velocity ripple or motion profile requirements • Precise force control	★Applications: Wafer/LCD/PV/battery handling, testing, inspection and assembly, laser processing machines, metrology equipment and gene sequencing machines and other medical equipment
 ALM-T Series	• Small thickness, light weight and high force density • Zero cogging force and smooth operation • High dynamic response • Optional digital hall modules	▶Applicable to: • Point-to-point micron/nanometer level positioning • High/low speed applications with demanding velocity ripple or motion profile requirements • Precise force control	★Applications: Semiconductor, flat panel display, ultra-precision stages, biomedicine/ lab automation, optics
 AWM Series	• High force and stiffness • High motor constant • Efficiency • Low energy consumption • Shorter coil	▶Applicable to: • Submicron/nanometer level positioning in vacuum environment	★Applications: Vacuum inspection equipment in both front-end and back-end semiconductor industries
 ACR Series	• Zero cogging force • Large center hole • Thin and compact coil with low motor mass • Configurable angle of rotation by attaching multiple magnet tracks	▶Applicable to: • Point-to-point micron/nanometer level positioning • High/low speed applications with demanding velocity ripple or motion profile requirements	★Applications: Wafer/LCD inspection equipment, laser processing machines and metrology equipment
 RDM-A Series	• Compact size • Full utilization of flux lines • Ironless, no cogging force • Convenient replacement of lead screw upgrade • Multi-mover on one track available	▶Applicable to: • Point-to-point micron/nanometer level positioning • High/low speed applications with demanding velocity ripple or motion profile requirements • Precise force control	★Applications: High-speed printer, biomedical equipment, semiconductor equipment, CNC (wire cut EDM machine, etc.), single/multi-axis module platform, counterpoint platform, Z-axis pick-and-place module

Iron Core Technology

 AJM Series	• High force and stiffness • High temperature tolerance • Low cogging force • Max bus voltage 600Vdc	▶Applicable to: • Point to point micron meter level positioning • Applications with high force, speed and acceleration requirements • Higher cost-effectiveness in long stroke applications	★Applications: Wafer/LCD/PV/battery handling, testing, dispensing and assembly, laser processing machines, packaging machines and printing equipment
 AQM Series	• High force and stiffness • High temperature tolerance • Low cogging force • Max bus voltage 600Vdc • Narrow width • Cost-effective	▶Applicable to: • Point to point micron meter level positioning • Applications with high force, speed and acceleration requirements • Higher cost-effectiveness in long stroke applications	★Applications: Wafer/LCD/PV/battery handling, testing, dispensing and assembly, laser processing machines, packaging machines and printing equipment
 AKM Series	• High force and stiffness • High temperature tolerance • Low cogging force • Max bus voltage 600Vdc • Patented water cooling design	▶Applicable to: • Point to point micron meter level positioning • Applications with high force, speed and acceleration requirements • Higher cost-effectiveness in long stroke applications	★Applications: Wafer/LCD/PV/battery handling, testing, dispensing and assembly, laser processing machines, packaging machines, printing equipment and machining centers
 AKH Series	• Natural cooling, water cooling optional • Small size and high thrust force • High response and bandwidth • High motor constants • Patented water cooling design • Max bus voltage 600Vdc	▶Applicable to: • Suitable for applications with strict requirements of speed, accuracy, and response performance • Also, applicable to point-to-point micron level positioning with max speed of 5m/s or faster	★Applications: CNC machines， including laser processing machines, mold machines, lathes, grinders, etc; high-speed positioning system for handling applications; semiconductor, PV, lithium battery, glass and LCD

Overview

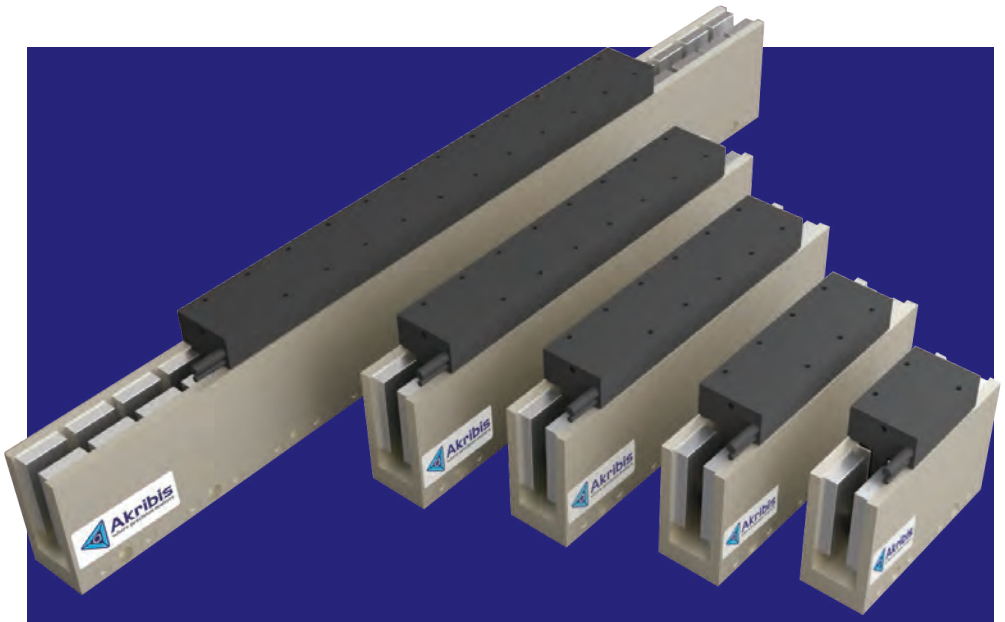


Flexible structure design contributes to excellent and simple high-precision control system:

- Multi-carriage structure
- Optional moving track design instead of moving coil, eliminating cable management and potential cable damage
- Multiple coils can be connected in series or parallel to generate higher force and faster speed while maintaining compact size

Please contact Akribis Sales engineers for more details （cust-service@akribis-sys.com）.

Applications & Industries: electronics, semiconductor, solar energy, lithium battery, PCB, FPD, HDD, LED, lathe, vehicle electronics, packaging, printing, optics, biomedical and many more.



AUM SERIES

- Ironless technology
- Zero cogging force
- Patented technology
- Small electrical and mechanical constant
- High continuous force and peak force

EN-25.5.1

Akribis systems

AUM Series

Introduction

AUM series Ironless brushless linear motors are compact in size but high in force density, achieving larger thrust force.

Continuous Force Fcn = 3N ~ 1980N
Peak Force Fpk = 11.9N ~ 16200N

Applications

- Ironless technology and no cogging force
- High continuous and peak force
- Optional hall sensors
- High motor constant
- Wide range of forces and sizes to choose from
- Optional air cooling and water cooling configurations

Features

Applicable to point-to-point micron/nanometer level positioning; unlimited travel stroke with top speed of 5m/s or faster; low velocity ripple during both fast and low speed scanning; precise force control with fine resolution.
Applications & Industries: high speed and precision machines for positioning, motion profile tracking, velocity controlling used in front-end & back-end wafer handling and inspection, photovoltaic and lithium battery systems, glass and LCD applications, biomedical equipment, printing machines and laser processing machines.

	Storage		10%RH to 90%RH (non-condensing)				
Recommended Ambience			Indoor (no direct sunlight); No corrosive gas, inflammable gas, oil mist or dust.				

❶ Measurement is taken at ambient temperature 25°C. Value depends on the thermal environment. Abbreviations: NC-Natural Cooling, AC-Air Cooling, WC-Water Cooling.

❷ Resistance is measured by DC current with standard 0.5 m cable.

❸ Inductance is measured by current frequency of 1 kHz. The variation range of AUM inductance is ±50% because three phase inductances are different. The value in the catalog is the average between the maximum and minimum values. For each phase, the variation range is ±25%.

The contents of datasheet are subject to change without prior notice.

	Storage	10%RH to 90%RH (non-condensing)
Recommended Ambience		Indoor (no direct sunlight); No corrosive gas, inflammable gas, oil mist or dust.

[1] Measurement is taken at ambient temperature 25°C. Value depends on the thermal environment. Abbreviations: NC-Natural Cooling, AC-Air Cooling, WC-Water Cooling.

[2] Resistance is measured by DC current with standard 0.5 m cable.

[3] Inductance is measured by current frequency of 1 kHz. The variation range of AUM inductance is ±40% because three phase inductances are different. The value in the catalog is the average between the maximum and minimum values. For each phase, the variation range is ±20%.

[4] Both the standard and NTRL versions are recommended to use a bus voltage of up to 330Vdc.

Other Information															
Insulation Class			Class B (130°C)												
Protection Grade			IP00												
Compliance with Global Standards			RoHS, CE, NTRL(option)												
Ambient Temperature	Operation		0°C to 40°C (non-freezing)												
	Storage		-15°C to 70°C (non-freezing)												
Ambient Humidity	Operation		10%RH to 80%RH (non-condensing)												
	Storage		10%RH to 90%RH (non-condensing)												
Recommended Ambience			Indoor (no direct sunlight); No corrosive gas, inflammable gas, oil mist or dust.												

[1] Measurement is taken at ambient temperature 25°C. Value depends on the thermal environment. Abbreviations: NC-Natural Cooling, AC-Air Cooling, WC-Water Cooling.

[2] Resistance is measured by DC current with standard 0.5 m cable.

[3] Inductance is measured by current frequency of 1 kHz. The variation range of AUM inductance is ±40% because three phase inductances are different. The value in the catalog is the average between the maximum and minimum values. For each phase, the variation range is ±20%.

[4] Water cooling test conditions: the inlet water temperature of motor is 20°C, and the flow rate is 1.5 L/min for S1-S5, and the flow rate is 2 L/min for S6-S12. (For detailed test conditions, please consult Akribis)

[5] The bus voltage of the standard version supports up to 330Vdc, and the bus voltage of the NTRL version supports up to 600Vdc.

ALM-T SERIES

- Small thickness, light weight and high force density
- Zero cogging force and smooth operation
- High dynamic response
- Optional digital hall modules

EN-25.5.1

Introduction

ALM-T is a kind of ironless linear motor, featuring zero cogging force, light weight and high force density. It's suitable for applications with demanding velocity ripple and dynamic response, as well as force control application.

Continuous force Fcn = 10.0N ~ 846.0N
Peak force Fpk = 36.0N ~ 4233.6N

Features

- Small thickness, light weight and high force density
- Zero cogging force and smooth operation
- High dynamic response
- Optional digital hall modules

Applications

The ALM-T motors are suitable to be integrated in modules with small thickness, running with high speed, especially in areas such as:

- Semiconductor
- Flat panel display
- Ultra-precision stages
- Biomedicine / Lab automation
- Optics

AJM SERIES

- Iron core technology
- Low cogging force
- Integrated with hall sensors
- High force and stiffness

EN-25.5.1

Introduction

Iron core AJM series linear motors provide compact size, high force density and quick response.

Continuous Force Fcn = 44.0N ~ 446.8N

Peak Force Fpk = 117.0N ~ 1409.1N

Features

- Iron core technology and low cogging force
- High continuous and peak force
- Optional hall sensors
- High motor constant

Applications

Best suited for point-to-point motion with micron level positioning ; unlimited travel stroke with top speed of 5m/s or faster (stroke of 100m or longer).

Applications & Industries: high speed positioning systems for product handling in semiconductor, photovoltaic and lithium battery, glass and LCD applications, as well as industrial printing machines, laser processing machines with demanding precision and motion control requirements.

AQM SERIES

- Ironcore technology
- Low cogging force
- Higher cost performance
- High response and flexibility
- High force and stiffness

EN-25.5.1

Akribis systems

Introduction

Iron Core AQM series linear motors have a low cogging force, a competitive cost advantage, exceptionally narrow width for dimenionally constraintedapplications and are ideal for long travel strokes.

Continuous Force Fcn = 20.3N ~ 506.0N

Peak Force Fpk = 49.7N ~ 1243.0N

Features

- Iron core technology and low cogging force
- Higher cost performance
- Multiple coil lengths to select

Applications

Applicable to point-to-point micron meter level positioning; unlimited travel stroke with top speed of 5m/s or faster (stroke of 100m or longer).

Applications & Industries: high speed positioning systems for product handling in semiconductor, photovoltaic and lithium battery, glass and LCD applications, as well as industrial printing machines, laser processing machines with demanding precision and motion control requirements.

	Storage	10%RH to 90%RH (non-condensing)		
Recommended Ambience		Indoor (no direct sunlight); No corrosive gas, inflammable gas, oil mist or dust.		

[1] Measurement is taken at ambient temperature 25°C. Value depends on the thermal environment. Abbreviations:NC-Natural Cooling.

[2] Resistance is measured by DC current with standard 0.5 m cable.

[3] Inductance is measured by current frequency of 1 kHz.

AKM SERIES

- Iron core technology
- Low cogging force
- Integrated with hall sensors
- High force and stiffness

EN-25.5.1

Introduction

Iron Core AKM series linear motors provide the highest force for the smallest package size. This series also has a wide range of sizes and optional water-cooling configurations which are ideal for aggressive higher force and duty cycle applications.

Continuous Force Fcn = 108.4N ~ 6190.1N

Peak Force Fpk = 241.6N ~ 12884.3N

Features

- Iron core technology and low cogging force
- High continuous and peak force
- Optional hall sensors
- High motor constant
- Multiple coil lengths to select

Applications

Applicable to point-to-point micron meter level positioning; unlimited travel stroke with top speed of 5m/s or faster (stroke of 100m or longer).

Applications & Industries: high speed positioning systems for product handling in semiconductor, photovoltaic and lithium battery, glass and LCD applications, as well as machining centers, industrial printing machines, laser processing machines with demanding precision and motion control requirements.

Continuous Power Dissipation (NC) @100℃ ❶		P_{cn}	W	49.9
Max. Coil Temperature		t_{max}	℃	100
Thermal Dissipation Constant (NC) ❶		K_{thn}	W/℃	0.7
Max. Bus Voltage		U_{bus}	Vdc	600
Magnetic Period		τ_{NN}	mm	42
Attraction Force		F_a	kN	0.4
Mechanical Parameters				
Coil Mass (NC)		m_{cn}	kg	1.5
Coil Length (NC)		L_{cn}	mm	112
Track Mass Per Meter		m_{track}	kg	2.6
Other Information				
Insulation Class		Class B (130℃)		
Protection Grade		IP00		
Compliance with Global Standards		RoHS, CE, UL(option)		
Ambient Temperature	Operation	0℃ to 40℃ (non-freezing)		
	Storage	-15℃ to 70℃ (non-freezing)		
Ambient Humidity	Operation	10%RH to 80%RH (non-condensing)		
	Storage	10%RH to 90%RH (non-condensing)		
Recommended Ambience		Indoor (no direct sunlight); No corrosive gas, inflammable gas, oil mist or dust.		

❶Measurement is taken at ambient temperature 25℃. Value depends on the thermal environment. Abbreviations: NC-Natural Cooling.
❷Resistance is measured by DC current with standard 0.5 m cable.
❸Inductance is measured by current frequency of 1 kHz.
The contents of datasheet are subject to change without prior notice.

Ambient Temperature	Operation	0°C to 40°C (non-freezing)		
	Storage	-15°C to 70°C (non-freezing)		
Ambient Humidity	Operation	10%RH to 80%RH (non-condensing)		
	Storage	10%RH to 90%RH (non-condensing)		
Recommended Ambience		Indoor (no direct sunlight); No corrosive gas, inflammable gas, oil mist or dust.		

[1] Measurement is taken at ambient temperature 25°C. Value depends on the thermal environment. Abbreviations: NC-Natural Cooling.

[2] Resistance is measured by DC current with standard 0.5 m cable.

[3] Inductance is measured by current frequency of 1 kHz.

The contents of datasheet are subject to change without prior notice.

AKH SERIES

- Iron core technology
- Low cogging force
- Fast response and high bandwidth
- High force density and low mass

EN-25.5.1

Akribis systems

AKH Series

Introduction

AKH series motor provides various sizes and two different cooling systems, water-cooling and nature-cooling. It features with compact size, high force density, and quick response, which is suitable for applications with strict requirements of speed, accuracy, and response performance.

Continuous Force Fcn = 631N ~ 9750N

Peak Force Fpk = 2400N ~ 20735N

Features

- Self-cooling, water-cooling optional
- Small size and high thrust force
- High response and bandwidth
- High motor constants
- Patented water-cooling design
- Max bus voltage of 600Vdc

Applications

Suitable for applications with strict requirements of speed, accuracy, and response performance. Also, applicable to point-to-point micron level positioning with max peed of 5m/s or faster. Applications & Industries: CNC machines， including laser processing machines, mold machines, lathes, grinders, etc;High-speed positioning system for handling applications;Semiconductor, PV, lithium battery, glass and LCD

Other Information				
Insulation Class		Class B (130℃)		
Protection Grade		IP00		
Compliance with Global Standards		RoHS, CE, UL(option)		
Ambient Temperature	Operation	0℃ to 40℃ (non-freezing)		
	Storage	-15℃ to 70℃ (non-freezing)		
Ambient Humidity	Operation	10%RH to 80%RH (non-condensing)		
	Storage	10%RH to 90%RH (non-condensing)		
Recommended Ambience		Indoor (no direct sunlight); No corrosive gas, inflammable gas, oil mist or dust.		

❶ Measurement is taken at ambient temperature 25℃. Value depends on the thermal environment. Abbreviations:WC-Water Cooling.
❷ Resistance is measured by DC current with standard 0.5 m cable.
❸ Inductance is measured by current frequency of 1 kHz.
❹ Water cooling test conditions: the inlet water temperature of motor is 20℃, and the flow rate is 6 L/min.
The contents of datasheet are subject to change without prior notice.

Insulation Class		Class B (130°C)		
Protection Grade		IP00		
Compliance with Global Standards		RoHS, CE, UL(option)		
Ambient Temperature	Operation	0°C to 40°C (non-freezing)		
	Storage	-15°C to 70°C (non-freezing)		
Ambient Humidity	Operation	10%RH to 80%RH (non-condensing)		
	Storage	10%RH to 90%RH (non-condensing)		
Recommended Ambience		Indoor (no direct sunlight); No corrosive gas, inflammable gas, oil mist or dust.		

❶ Measurement is taken at ambient temperature 25°C. Value depends on the thermal environment. Abbreviations:WC-Water Cooling.

❷ Resistance is measured by DC current with standard 0.5 m cable.

❸ Inductance is measured by current frequency of 1 kHz.

❹ Water cooling test conditions: the inlet water temperature of motor is 20℃, and the flow rate is 6 L/min.

The contents of datasheet are subject to change without prior notice.

AWM SERIES

- Ironless technology
- Vacuum Compatible (RGA tested)
- Zero cogging force
- High Motor Constant
- High continuous force and peak force

EN-25.5.1

Introduction

AWM series linear motors are vacuum compatible ironless motors with no cogging force and high continuous/peak forces.

Continuous Force Fcn = 4.5N-769.1N

Peak Force Fpk = 22.3N-3845.3N

Features

- Vacuum compatible (RGA tested in 1×10^{-7} Torr vacuum)
- Ironless technology and no cogging force
- High continuous and peak force
- High motor constant
- Multiple coil lengths to select

Applications

Applicable to point-to-point micron/nanometer level positioning; unlimited travel stroke with top speed of 5m/s or faster; low velocity ripple during both fast and low speed scanning; precise force control with fine resolution.

Applications & Industries: front-end & back-end wafer handling and inspection, glass and LCD applications, and biomedical applications that require vacuum compatibility, high speed, precise motion and velocity control.

ACR SERIES

- Small thickness and light weight
- Large center hole
- Integrated hall sensor and temperature sensor
- Direct drive with high torque without cogging effect
- Limit-angle or 360-degree operation
- Multi-coil and multi-track configurations

Introduction

Ironless ACR series arc motors are specifically desinged for angular motion with constrained rotation angles less than 360 degrees. Compared with DDR motors, Akribis's ACR series arc motors feature larger center holes, lower profile form factors, and higher stiffness. When coupled with larger radius circular encoder sacles and arc bearings, ACR motors can achieve better postioning, repeatability, and accuracy.

Continuous Torque T_{cn} = 19.8Nm ~ 460.7Nm

Peak Torque T_{pk} = 72.8Nm ~ 1382.2Nm

Features

- Ironless technology and no cogging force
- Thin coil design with low mass
- High motor constant
- Big center hole
- Integrated hall sensors
- Flexible configuration with multiple coils or tracks
- Multiple coils connected in series or parallel to increase torque output
- Multiple tracks attaching together to extend angle of rotation

Applications

In applications with limited angle of rotation where direct drive rotary motors are not necessary, ACR series arc motors can effectively lower cost and save space, particularly in systems with large radius of motion. Compared with conventional direct drive rotary motors, ACR arc motors can provide larger center hole, lower profile, and great torque output with optimized electromagnetic and mechanical design. ACR arc motors enable customers to develop more compact systems and to increase competitivity in the market.

Akribis ACR series arc motors are applicable to G2.5, G4.5, G6, G8.5, G10.5 and G11 LCD, 8-inch or 12-inch wafer processing and inspection equipment, as well as biomedical devices, precision assembly and industrial printing machines.

■ Limit-angle type

Model	Motion Radius (mm)
ACR240	240
ACR335	335
ACR820	820
ACR1240	1240
ACR1525	1525

■ 360° type

Model	Motion Radius (mm)
ACR240	240
ACR335	335
ACR820	820
ACR1240	1240
ACR1525	1525

Configurations

Akribis ACR series arc motors allow customers to flexibly configure systems based on their needs: multiple coils to increase torque output, or multiple tracks to increase range of motion. By attaching multiple tracks together, ACR motors can accomplish full 360° degrees of rotation.

RDM-A SERIES

- Compact size
- Full utilization of flux lines
- Ironless, no cogging force
- Multi-mover on one track available

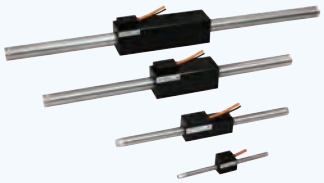
EN-25.5.1

Akribis systems

Introduction

RDM-A series is a kind of rod motor or shaft motor, since its magnet track is rod-shaped. Similar to other linear motors, RDM-A normally consists of a mover and a stator to realize a linear movement. Usually, the mover refers to motor coil, and the stator refers to magnet track. In some cases, the application of "mover" and "stator" can be reversed.

RDM-A Series	Mover (coil)	Stator (magnet track)
		



The magnetic flux is evenly distributed along the circumference of the magnets. The coils are round and arranged closely in the axial direction. For RDM-A series, there is an air gap between the coil and the magnet track to realize a non-contact axial linear movement.

Continuous Force Fcn = 2.1N~137.8N

Peak Force Fpk = 6.2N~413.4N

Features

- Compact size, similar to ball screw shape, convenient to replace traditional transmission method
- Full utilization of flux lines
- Ironless, no attraction force between mover and stator, easy for assembly
- No cogging force, smooth operation (RDM-A series)
- Multi-mover on one track available, flexible configuration

Applications

The size of RDM-A varies from 20mm-width coil (8mm-diameter shaft) to 60mm-width coil (30mm-diameter shaft), and each size contains several options of coil lengths and track lengths, together there are over dozens of stroke choices.

The symmetrical and compact structure enables rod motor to become the best alternative to iterate or upgrade ball screw mechanism.

- High-speed printer
- Biomedical equipment
- Semiconductor equipment
- CNC (Wire cut EDM machine, etc.)
- Single/multi-axis module platform
- Counterpoint platform
- Z-axis pick-and-place module

Coil Mass (NC)	m_{coil}	kg	1.38	1.71	2.03
Coil Length (NC)	L_{coil}	mm	145.0	181.0	217.0
Track Mass per Meter	m_{track}	kg/m	5.37	5.37	5.37
Other Information					
Insulation Class			Class B (130℃)		
Protection Grade			IP00		
Compliance with Global Standards			RoHS,CE		
Ambient Temperature	Operation		0℃ to 40℃ (non-freezing)		
	Storage		-15℃ to 70℃ (non-freezing)		
Ambient Humidity	Operation		10%RH to 80%RH (non-condensing)		
	Storage		10%RH to 90%RH (non-condensing)		
Recommended Ambience			Indoor (no direct sunlight); No corrosive gas, inflammable gas, oil mist or dust		

❶Measurement is taken at ambient temperature 25℃. Value depends on the thermal environment.
Abbreviations: NC-Natural Cooling.
❷Resistance is measured by DC current with standard 0.5m cable.
❸Inductance is measured by current frequency of 1 kHz.
The contents of datasheet are subject to change without prior notice.

AVM SERIES

- Direct drive, zero cogging, zero backlash voice coil motors
- Low coil mass with very fast response and bandwidth
- No contact between coil and core movement (no wear and tear)
- Smooth motion at low speeds with limitless resolution (depends on feedback device)

AVM12-6.4

Performance Parameters		Symbol	Unit	AVM12-6.4

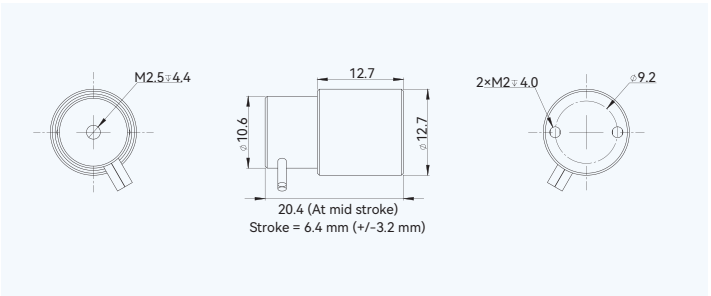
Running Clearance		L_{gap}	mm	0.35
Other Information				
Insulation Class		Class A (105°C)		
Protection Grade		IP00		
Compliance with Global Standards		RoHS		
Ambient Temperature	Operation	0°C to 40°C (non-freezing)		
	Storage	-15°C to 70°C (non-freezing)		
Ambient Humidity	Operation	10%RH to 80%RH (non-condensing)		
	Storage	10%RH to 90%RH (non-condensing)		
Recommended Ambience		Indoor (no direct sunlight); No corrosive gas, inflammable gas, oil mist or dust.		

Dimension



❶ Measurement is taken at ambient temperature 25°C. Value depends on the thermal environment.
❷ The values are at mid stroke.
❸ Resistance is measured by DC current with standard 0.5 m lead wire.
❹ Inductance is measured by current frequency of 1 kHz.
The contents of datasheet are subject to change without prior notice.

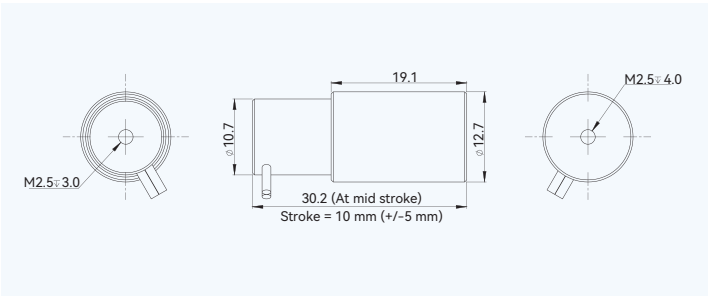
Other Information				
Insulation Class		Class A (105°C)		
Protection Grade		IP00		
Compliance with Global Standards		RoHS		
Ambient Temperature	Operation	0°C to 40°C (non-freezing)		
	Storage	-15°C to 70°C (non-freezing)		
Ambient Humidity	Operation	10%RH to 80%RH (non-condensing)		
	Storage	10%RH to 90%RH (non-condensing)		
Recommended Ambience		Indoor (no direct sunlight); No corrosive gas, inflammable gas, oil mist or dust.		

Dimension



❶ Measurement is taken at ambient temperature 25°C. Value depends on the thermal environment.
❷ The values are at mid stroke.
❸ Resistance is measured by DC current with standard 0.5 m lead wire.
❹ Inductance is measured by current frequency of 1 kHz.
The contents of datasheet are subject to change without prior notice.

AVM20-HF-15

Performance Parameters		Symbol	Unit	AVM20-HF-15
Stroke		S	mm	15.0

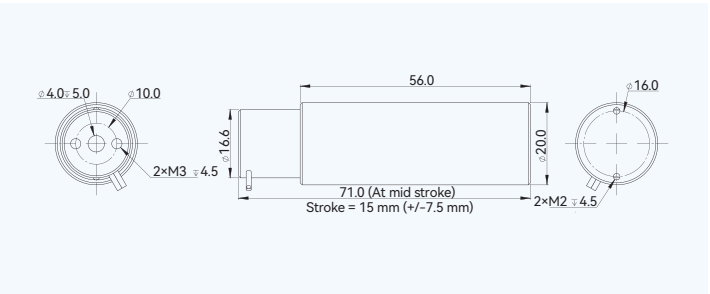
Other Information				
Insulation Class		Class A (105°C)		
Protection Grade		IP00		
Compliance with Global Standards		RoHS		
Ambient Temperature	Operation	0°C to 40°C (non-freezing)		
	Storage	-15°C to 70°C (non-freezing)		
Ambient Humidity	Operation	10%RH to 80%RH (non-condensing)		
	Storage	10%RH to 90%RH (non-condensing)		
Recommended Ambience		Indoor (no direct sunlight); No corrosive gas, inflammable gas, oil mist or dust.		

Dimension



❶ Measurement is taken at ambient temperature 25°C. Value depends on the thermal environment.
❷ The values are at mid stroke.
❸ Resistance is measured by DC current with standard 0.5 m lead wire.
❹ Inductance is measured by current frequency of 1 kHz.
The contents of datasheet are subject to change without prior notice.

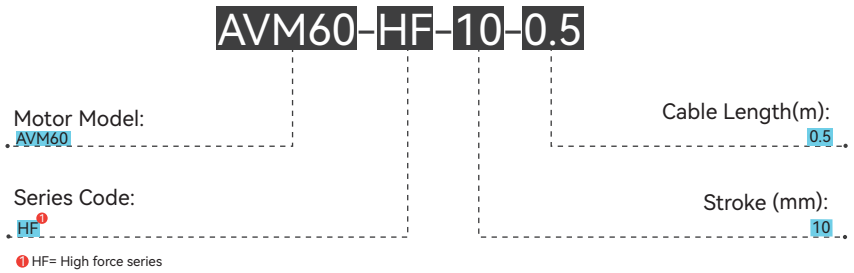
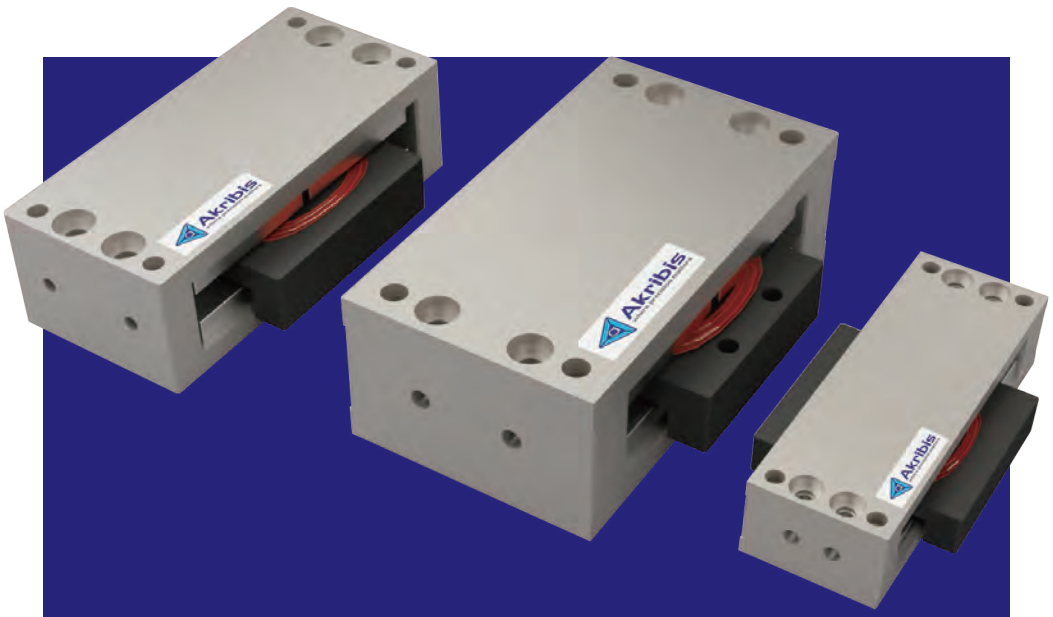
Part Numbering





AVA SERIES

- Direct drive, zero cogging, zero backlash voice coil motors
- Low coil mass with very fast response and bandwidth
- No contact between coil and core movement (no wear and tear)
- Smooth motion at low speeds with limitless resolution (depends on feedback device)

EN-25.2.1

ADR-A SERIES

- Direct drive brushless motor
- Fully integrated with encoder and bearing
- Low cogging torque
- Precise homing through index pulse
- Low and high speed windings are optional

EN-25.5.1

Akribis systems

Other Information				
Insulation Class			Class B (130°C)	
Protection Grade			IP40	
Compliance with Global Standards			RoHS, CE, UL (option)	
Ambient Temperature		Operation	0°C to 40°C (non-freezing)	
		Storage	-15°C to 70°C (non-freezing)	
Ambient Humidity		Operation	10%RH to 80%RH (non-condensing)	
		Storage	10%RH to 90%RH (non-condensing)	
Recommended Ambience			Indoor (no direct sunlight); No corrosive gas, inflammable gas, oil mist or dust.	

[1] Measurement is taken at ambient temperature 25°C. Value depends on the thermal environment.
[2] Resistance is measured by DC current with standard 0.5m cable.
[3] Inductance is measured by current frequency of 1kHz.
[4] The value is based on ABI optical SIN/COS encoder (4096x interpolation) under 330V bus voltage.
[5] Runout specification define in the datasheet is based on constant loading and temperature condition (the value in parenthesis is optional).
[6] Please refer to the illustration for different mountings.
[7] Based on ABI optical SIN/COS encoder (4096x interpolation) with standard runout.

The contents of datasheet are subject to change without prior notice.

❸ Inductance is measured by current frequency of 1kHz.
❹ The value is based on ABI optical SIN/COS encoder (4096x interpolation) under 330V bus voltage.
❺ Runout specification define in the datasheet is based on constant loading and temperature condition (the value in parenthesis is optional).
❻ Please refer to the illustration for different mountings.
❼ Based on ABI optical SIN/COS encoder (4096x interpolation) with standard runout.
The contents of datasheet are subject to change without prior notice.

ADR-B SERIES

- Large center bore
- Direct drive brushless motor
- Fully integrated with encoder and bearing
- Low cogging torque
- Precise homing through index pulse
- Low speed and high speed windings

Insulation Class		Class B (130°C)			
Protection Grade		IP40			
Compliance with Global Standards		RoHS, CE			
Ambient Temperature	Operation	0°C to 40°C (non-freezing)			
	Storage	-15°C to 70°C (non-freezing)			
Ambient Humidity	Operation	10%RH to 80%RH (non-condensing)			
	Storage	10%RH to 90%RH (non-condensing)			
Recommended Ambience		Indoor (no direct sunlight); No corrosive gas, inflammable gas, oil mist or dust.			

❶ Measurement is taken at ambient temperature 25°C. Value depends on the thermal environment.
❷ Resistance is measured by DC current with standard 0.5m cable.
❸ Inductance is measured by current frequency of 1kHz.
❹ The value is based on ABI optical SIN/COS encoder (4096x interpolation) under 330V bus voltage.
❺ Runout specification define in the datasheet is based on constant loading and temperature condition (the value in parenthesis is optional).
❻ Please refer to the illustration for different mountings.
❼ Based on ABI optical SIN/COS encoder (4096x interpolation) with standard runout.
The contents of datasheet are subject to change without prior notice.

Ambient Humidity		Operation	10%RH to 80%RH (non-condensing)	
		Storage	10%RH to 90%RH (non-condensing)	
Recommended Ambience			Indoor (no direct sunlight); No corrosive gas, inflammable gas, oil mist or dust.	

❶ Measurement is taken at ambient temperature 25°C. Value depends on the thermal environment.
❷ Resistance is measured by DC current with standard 0.5m cable.
❸ Inductance is measured by current frequency of 1kHz.
❹ The value is based on ABI optical SIN/COS encoder (4096x interpolation) under 330V bus voltage.
❺ Runout specification define in the datasheet is based on constant loading and temperature condition (the value in parenthesis is optional).
❻ Please refer to the illustration for different mountings.
❼ Based on ABI optical SIN/COS encoder (4096x interpolation) with standard runout.

The contents of datasheet are subject to change without prior notice.

Compliance with Global Standards			RoHS, CE		
Ambient Temperature	Operation		0°C to 40°C (non-freezing)		
	Storage		-15°C to 70°C (non-freezing)		
Ambient Humidity	Operation		10%RH to 80%RH (non-condensing)		
	Storage		10%RH to 90%RH (non-condensing)		
Recommended Ambience			Indoor (no direct sunlight); No corrosive gas, inflammable gas, oil mist or dust.		

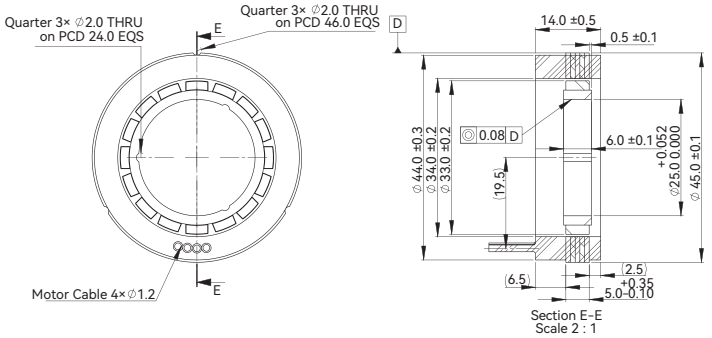
❶ Measurement is taken at ambient temperature 25°C. Value depends on the thermal environment. NC-Natural cooling
❷ Resistance is measured by DC current with standard 0.5 m cable.
❸ Inductance is measured by current frequency of 1 kHz.
❹ The value is based on max. bus voltage.
The contents of datasheet are subject to change without prior notice.

Dimension



Note:
❶ The concentricity of stator and rotor to be within 0.1mm when mounted;
❷ User to ensure flatness of mounting surface within 0.01/300mm;
❸ Comes without temperature sensor;
❹ Motor must be used with a Variable Frequency Driver;
❺ Cable diameter within +/-0.3mm tolerance, cable length within +/-30.0mm tolerance;
❻ Certain specifications in the drawing are subject to change.

	Storage	10%RH to 90%RH (non-condensing)		
Recommended Ambience		Indoor (no direct sunlight); No corrosive gas, inflammable gas, oil mist or dust.		

❶ Measurement is taken at ambient temperature 25°C. Value depends on the thermal environment. NC-Natural cooling

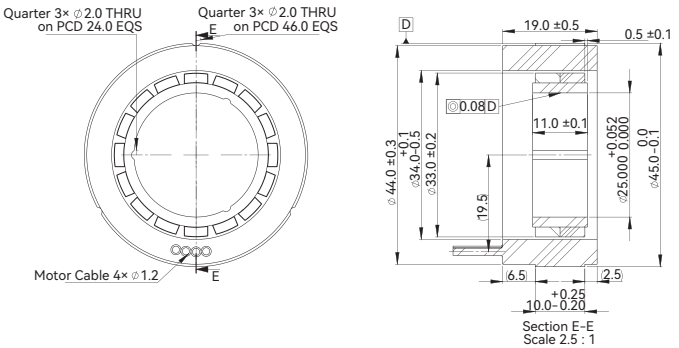
❷ Resistance is measured by DC current with standard 0.5 m cable.

❸ Inductance is measured by current frequency of 1 kHz.

❹ The value is based on max. bus voltage.

The contents of datasheet are subject to change without prior notice.

Dimension



Note:

❶ The concentricity of stator and rotor to be within 0.08mm when mounted;

❷ User to ensure flatness of mounting surface within 0.01/300mm;

❸ Comes without temperature sensor;

❹ Motor must be used with a Variable Frequency Driver;

❺ Cable diameter within +/-0.3mm tolerance, cable length within +/-30.0mm tolerance;

❻ Certain specifications in the drawing are subject to change;

❼ Customers need to connect ground wire by themselves;

❽ No epoxy on either end.

Ambient Humidity	Operation		10%RH to 80%RH (non-condensing)		
	Storage		10%RH to 90%RH (non-condensing)		
Recommended Ambience			Indoor (no direct sunlight); No corrosive gas, inflammable gas, oil mist or dust.		

❶ Measurement is taken at ambient temperature 25°C. Value depends on the thermal environment.
❷ Resistance is measured by DC current with standard 0.5m cable.
❸ Inductance is measured by current frequency of 1 kHz.
❹ The value is based on ABI optical SIN/COS encoder (4096x interpolation) under max. bus voltage.
❺ Runout specification define in the datasheet is based on constant loading and temperature condition (the value in parenthesis is optional).
❻ Please refer to the illustration for different mountings.
❼ Based on ABI optical SIN/COS encoder (4096x interpolation) with standard runout.
The contents of datasheet are subjected to change without prior notice.

Compliance with Global Standards			RoHS, CE		
Ambient Temperature	Operation		0°C to 40°C (non-freezing)		
	Storage		-15°C to 70°C (non-freezing)		
Ambient Humidity	Operation		10%RH to 80%RH (non-condensing)		
	Storage		10%RH to 90%RH (non-condensing)		
Recommended Ambience			Indoor (no direct sunlight); No corrosive gas, inflammable gas, oil mist or dust.		

[1] Measurement is taken at ambient temperature 25°C. Value depends on the thermal environment.
[2] Resistance is measured by DC current with standard 0.5m cable.
[3] Inductance is measured by current frequency of 1kHz.
[4] The value is based on ABI optical SIN/COS encoder (4096x interpolation) under max. bus voltage.
[5] Runout specification define in the datasheet is based on constant loading and temperature condition (the value in parenthesis is optional).
[6] Please refer to the illustration for different mountings.
[7] Based on ABI optical SIN/COS encoder (4096x interpolation) with standard runout.
The contents of datasheet are subject to change without prior notice.

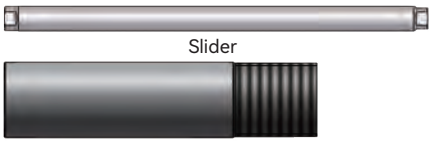
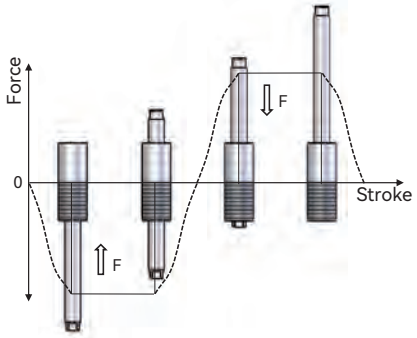
MAGNET SPRING

MAGNET SPRING

The magnetic spring of MSP-A series, consists of a slider and a stator. The bushing is installed inside the stator, guiding the relative movement between slider and stator.



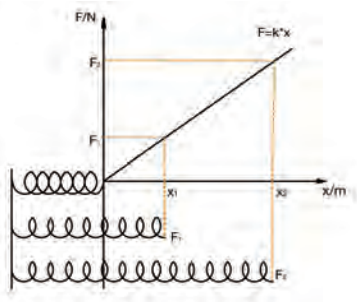
The principle of the magnetic spring is to use the interaction of the permanent magnets inside the slider and stator to generate a force. The force is free of external power source and control. It maintains a constant direction and magnitude within the specific travel range. The figure below illustrates the relationship between the force vector and the stroke.



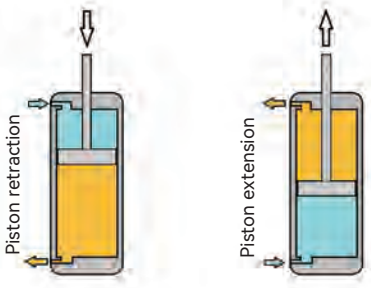
There are two common problems in the application of Z-axis direct drive modules. Firstly, if there is no external force to balance the gravity of the moving parts, the motor has to provide an additional current input during the upward acceleration. This results in an increase of motor temperature. Secondly, in the event of sudden power cutoff, the moving components will fall due to gravity, causing damage.

Presently, mechanical springs or air cylinders are often used in the market to balance the gravity. However, for the mechanical spring, its stiffness is not good and its force is not consistent. In addition, it can only be perfectly maintained at a fixed position as shown in the schematic diagram of mechanical spring. Whereas, for the air cylinder, an external pipeline is essential. An external power supply is required for controlling the pressure and pressure difference, where the problem of moving parts falling and crashing potentially exists. However, the magnetic spring has obvious advantages in performance, structure and response speed. The following table compares the differences among mechanical springs, air cylinders, and magnetic springs over several dimensions. In addition, the magnetic spring can also be flexibly installed in series or parallel in the module, so as to provide several times of the force that a single magnetic spring can achieve under heavy load conditions.

	Mechanical spring	Air cylinder	Magnetic spring
Performance	F=k*x, not constant (k: elastic coefficient x: deformation)	Constant force controlled by the pressure or pressure difference	Constant force within specific stroke
Structure	No guiding effect	Requiring external gas pipeline, with guiding effect	Guiding effect (MSP-A)
Maintenance	Inspection & lubrication	Depending on the air cylinder type	Inspection & lubrication (MSP-A)
Response speed	Affecting by natural frequency	Time consuming to balance the air pressure, non-instant response	Instant response

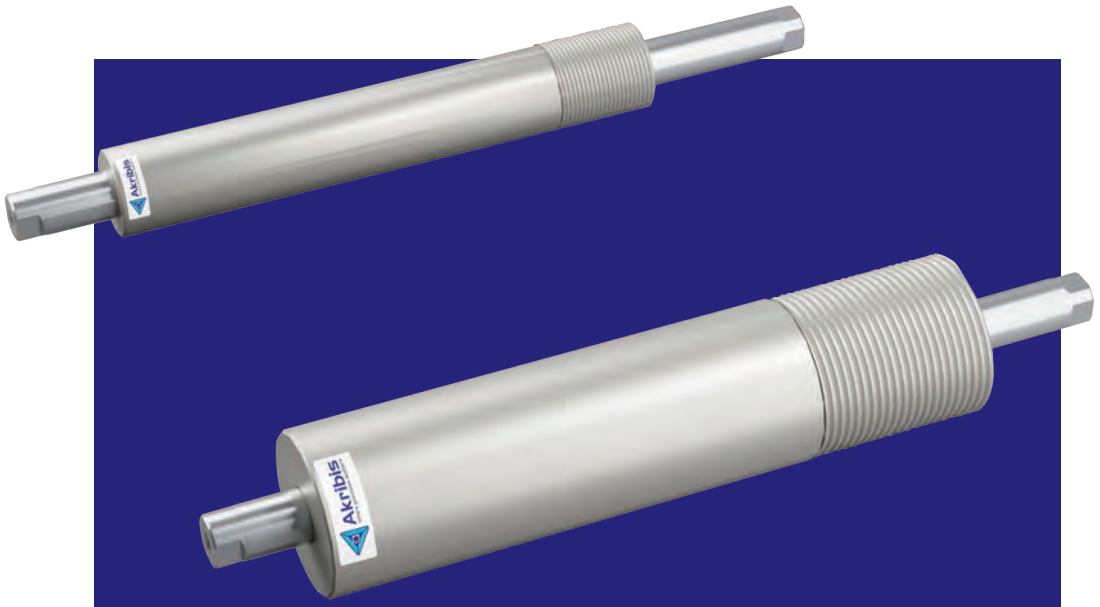


Schematic diagram of mechanical spring



Schematic diagram of air cylinder

The key to select a proper magnetic spring mainly depends on stroke and force output. The stroke is related to the relative position between slider and stator, as well as their lengths. The force range is related to the diameter of the slider and stator. With the help of proper sizing, the magnetic spring provides a stable gravity compensation during the reciprocating motion of the Z-axis direct drive module, and the moving parts are immediately hovered when the power is cutoff.



MSP-A SERIES

- Simple structure
- Constant force
- Instant response
- Free of power supply
- Free of linear guide
- Simple maintenance

EN-25.5.1

Akribis systems

Features

- Simple structure
- Constant force
- Instant response
- Free of power supply
- Free of linear guide
- Simple maintenance

Applications

Based on the features of magnetic springs, it can be used in many application scenarios, including but not limited to gravity compensation, ensuring Z-axis module self-locking when power off, and supplying constant force within specific travel range.

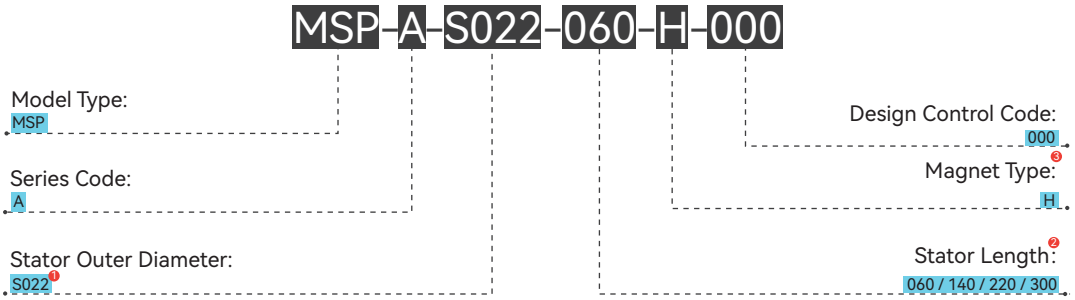
Part Numbering

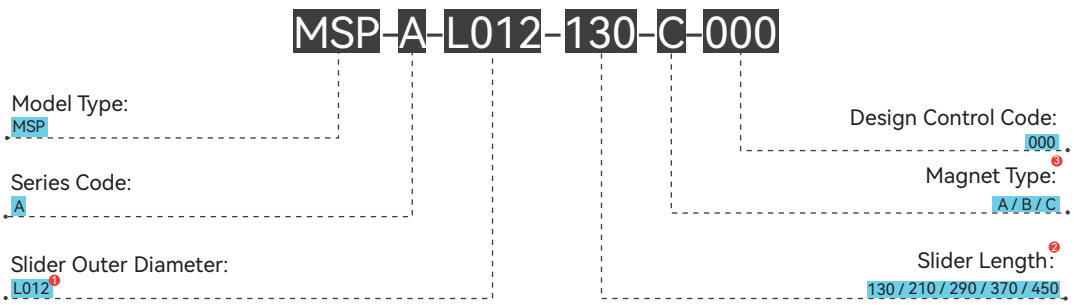
Stator



1. S022 = Stator Outer Diameter 22mm
2. E.g. 060 = 60mm
3. Magnet Type = Different Magnet Designs

1. S037 = Stator Outer Diameter 37mm
2. E.g. 080 = 80mm
3. Magnet Type = Different Magnet Designs

Slider

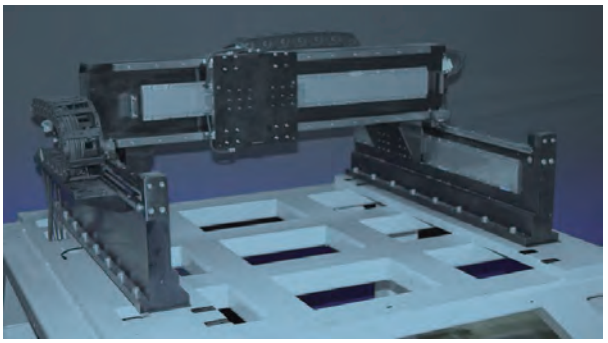


1. L012 = Slider Outer Diameter 12mm
2. E.g. 130 = 130mm
3. Magnet Type = Different Magnet Designs

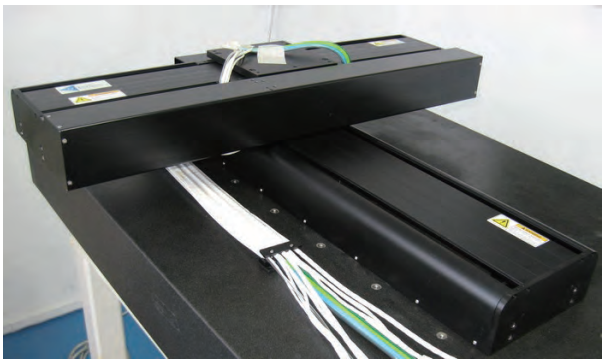
The stator and slider shall be used in pairs according to the combination parameters to achieve the specific performance (stroke & force).

Motion Control of Gantry Stages

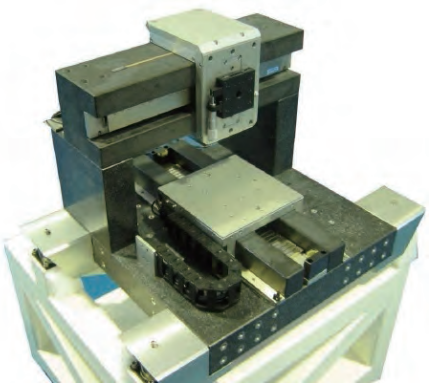
A gantry stage is basically an XY table where the top axis is supported by 2 axes at the bottom. The top axis and its payload is supported by 2 parallel linear bearings at the 2 sides of the stage. See picture on the right. This configuration allows the top axis to carry an end effector (like pick and place mechanism, camera, etc.) to access the work piece at any XY positions from the top.



A standard stacked XY table will usually have to move the work piece while the end effector is fixed on top. This is usually not recommended if the work piece is very big and heavy, or if the top axis stroke is very long. Since the top axis is only supported at the middle, it would deflect downwards at the 2 ends (more significant as the top axis length increases), resulting in poor flatness specifications. (See picture on the right.)



A nice hybrid configuration is to separate the X and Y where the top axis is mounted on a stationary bridge. In this case, the bottom axis carries the workpiece in one direction and the top axis carries the end effector to move in the orthogonal direction. (See picture on the right.)



In motion control, we are more concerned on the bottom axis of the first type of configuration (moving bridge). The load is supported at the 2 sides, it can easily creates yaw error if the driving force is not in line with the CG (center of gravity) of the moving load.

In motion control, we call the bottom axis of such configuration as gantry axis.

1.Types of gantry axis configuration

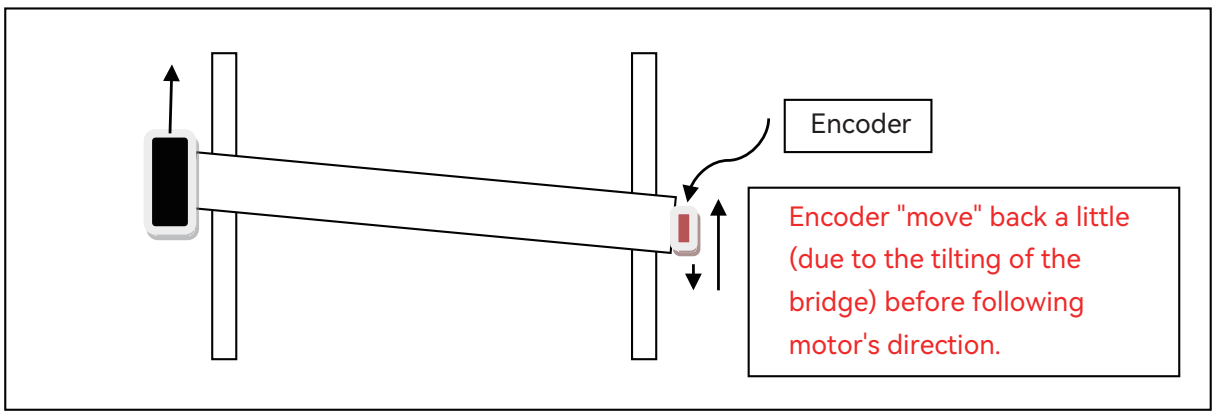
1.1 T-drive

T-drive is consists of a motor driving at one side, and linear bearing guiding the opposite site for the bottom axis, forming a T shaped configuration. This configuration requires only one driver and one encoder. It is the most cost effective gantry configuration.The ideal location for the encoder to be mounted is at the center of the gantry. However, this is hard to achieve. Most of the designs will have the encoder mounted on one side of the T-drive configuration.

The main disadvantage of this configuration is the unbalanced driving force. It is almost impossible to drive in line with the CG of load. This will result in high yaw error. The side without motor will always be dragged behind by the motor at the other side. When the motor changes direction, there will be big yaw error which result in high reversal error. In other words, the side without motor will remain stationary until the motor side has moved enough to drag it along.

To improve repeatability of this configuration, the recommended approach is to have the critical positions always in the same direction of the motion. This could mean over travelling in one direction then move back to the required direction. This would produce similar yaw error every time so that this yaw error doesn't contribute to the repeatability error of the gantry axis.

One important consideration in a T-drive configuration is the location of encoder with respect to the motor driving force. If it is opposite to the motor driving force, the encoder may register an opposite direction motion before it starts to follow the motor direction (see illustration below). This is, in a way, like a positive feedback situation that could affect servo performance. So, it is recommended to have the encoder at the same side of the motor.



1.2 H-drive

H-drive is consists of 2 motors, 1 driving each side of the gantry, forming a H shaped configuration. This would provide a more balanced driving force and minimize the problems experienced in T-drive configuration.

2.Encoder configurations

For H-drive configuration, there are options to use 1 or 2 encoders.

2.1 Single encoder

In single encoder configuration (again, usually mounted at one side of the gantry), both motors would receive the same feedback signal and have the same position error all the time. Essentially, both motors will output the same force all the time. However, this doesn't guarantee that there will be no yaw error because the load inertia and friction experienced at the 2 sides will not be the same. But generally, having motors driving at both sides would reduce the reversal error significantly as compared to T-drive configuration.

In this configuration, it is possible to use only one driver if the driver's current rating can drive the 2 motors connected in parallel. However, there will be only one hall sensors port in the driver, so the 2 motors must be aligned exactly to their respective magnetic tracks to ensure accurate commutation.

2.2 Dual encoders - one on each side of gantry

Having encoders at both sides of the gantry would provide actual position difference between the 2 motors.
However, this would require 2 separate position loops to control the 2 motors, it would require 2 drivers.

With 2 encoders, the stopping position can be controlled to the accuracy and repeatability of the encoders.

3.Rigid vs flexible link between the bridge and the gantry axis

In single encoder system, either T-drive or H-drive configuration, the bridge should be rigidly mounted on the gantry axis to minimize yaw error.

However, there are important factors for consideration in rigid link design.

3.1 Bridge length is fixed and fully constrained when rigidly mounted at the 2 ends

If the environment temperature changes, the top axis bridge will expand or contract. More importantly, the moving axis mounted on the bridge will generate heat and dissipate through the bridge. As the bridge length changes (it will be more significant if the bridge is long), the stress on the 2 linear bearings will increase, resulting in higher friction on the gantry axis. The bridge itself may also bend and twist which will affect the top axis as well.

3.2 Mechanical alignment of the 2 linear bearings

If the 2 bearings are not parallel or their straightness and/or flatness are not controlled, it would result in uneven friction across the full stroke of the gantry axis. Some part of the stroke will have higher friction than other parts.
This could affect servo performance and require higher driving force from the motors than the calculated force requirement.

It can be very costly to machine the base support of the gantry stage to the required accuracy if the gantry is big (sometimes may not be possible at all).

On the other hand, most rigidly mounted bearings will still have some small degree of compliance to allow some displacement in the orthogonal directions. So the performance (or if it is functional at all) depends on the machining accuracy, bearings clearance, gantry size, etc.

3.3 Rigid link with dual encoders

With 2 encoders, it will provide the Yaw error (position difference between the 2 motors) to the controller. However, the assembly error of the 2 encoder scales and the scales' error itself could result in similar effect as misaligned bearings. In this case, the controller will try to servo the 2 motors to the commanded position. So if there is encoder scale error and bridge length is fully constrained, the controller will output very high current to the motors trying to stretch, bend or twist the bridge in order minimize their respective position errors. The 2 motors will be fighting each other and result in instability and higher continuous force.

One way to handle the difference in encoder scale error (including assembly alignment tolerance) is to map the differential error in one of the driver to match the encoder reading of the other. In this case, the bridge will be at their naturally "relax" orientation (no fighting between the gantry motors). But this doesn't mean that the yaw error is zero. In fact, it is impossible to achieve zero yaw error all the time in rigid gantry unless the mechanical setup (parallelism, straightness, flatness, etc.) is perfect.

3.4 Flexible link

Flexible link means allowing some freedom in yaw direction at one side (usually called the gantry master), and on the other side, allow translational freedom in the top axis direction and yaw rotation (to allow expansion/contraction of bridge and rotation due to straightness error in gantry bearings and encoder scale error).

It requires 2 encoders and 2 controller axes (2 drivers) in order to control the yaw direction.
This is more costly in terms of the number of control components, but allows higher tolerance in the mechanical parts fabrication and assembly.

4.Controller configuration

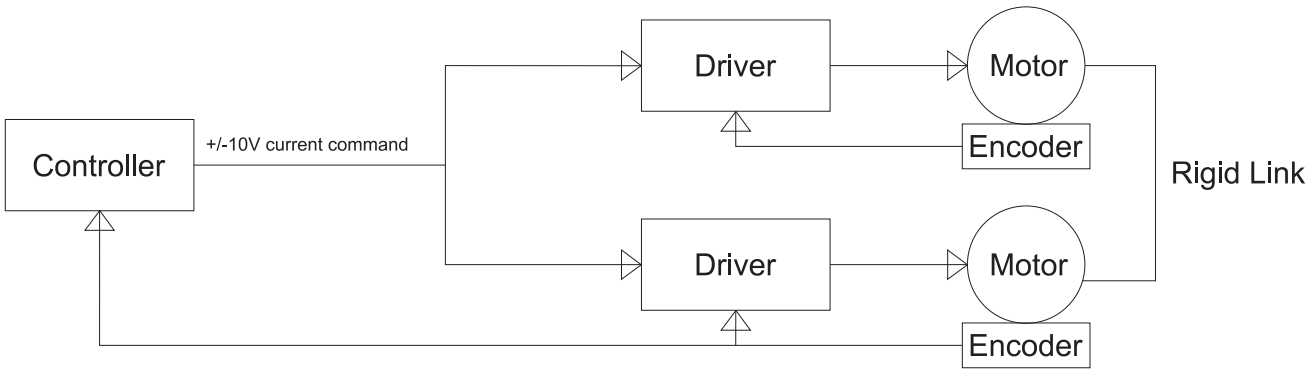
In single driver configuration, the controller will see the gantry as one motor and everything behave like a conventional axis. It is more important to size the driver and power supply based on the combined motor current and back EMF.
In dual-driver configuration, there are a few options.

4.1 Shared current command

This is similar to connecting the 2 gantry motors in parallel to a single driver with 1 encoder feedback. In the case when the driver's current or voltage rating could not support the 2 motors in parallel connection, it will be necessary to drive the motor separately with 2 drivers.

The controller treats the gantry as a single motor with only 1 position loop. The encoder feedback is used to compute current command and converted to a +/-10V analog signal, which is connected in parallel to the 2 drivers. Both motors should output the same force if their commutation alignment is the same.

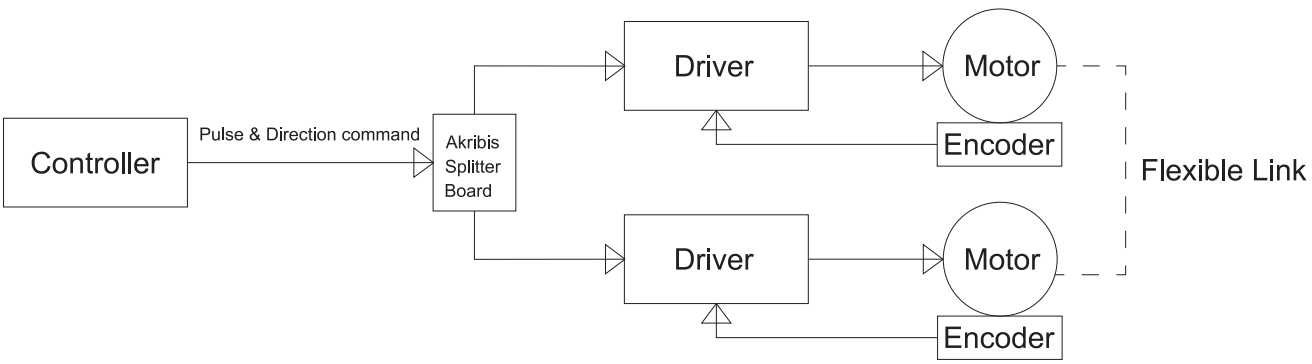
In the case when it is not easy to ensure good commutation alignment by mechanical design, it is possible to use separate encoders connected to their respective drivers for commutation purpose. Only one of the encoders will be connected to the controller since there is only 1 position loop.



4.2 Shared position command

Similar to shared current command, in this case, the 2 drivers are operating in position mode. The position command can be sent in pulse & direction or other equivalent formats. To ensure strong pulse signals are received at the 2 drivers, it is recommended to use a splitter circuit board from Akribis to split the signals.

Again, the controller treats this as a single motor and generate one motion path profile. Position control is done in the drivers, so it is possible to apply encoder error compensation separately in each driver to avoid fighting between the 2 motors.

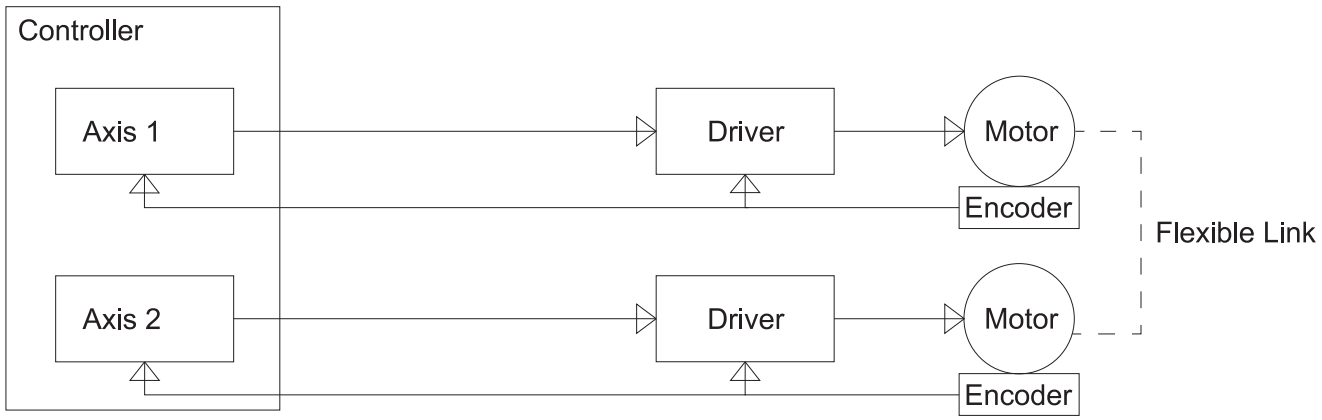


4.3 Vector mode or gear mode with 1:1 ratio

When the 2 drivers are connected to separate axes in the controller (this will take up 2 controller axes), it is possible to control the 2 motors separately. This may be necessary if the application requires some movement in the yaw axis (not always orthogonal to the main gantry axis). Of course, this would require a flexible link gantry design.

When moving in the main gantry direction, it is advisable to group the 2 axes in vector mode or gear mode because most controller has special error handling in such mode to decelerate and stop both motors together even if only one of the motors encountered an error condition.

If there isn't such protection in place, when one motor encountered error and stopped, the other may continue to move and could cause damage to the gantry mechanism.

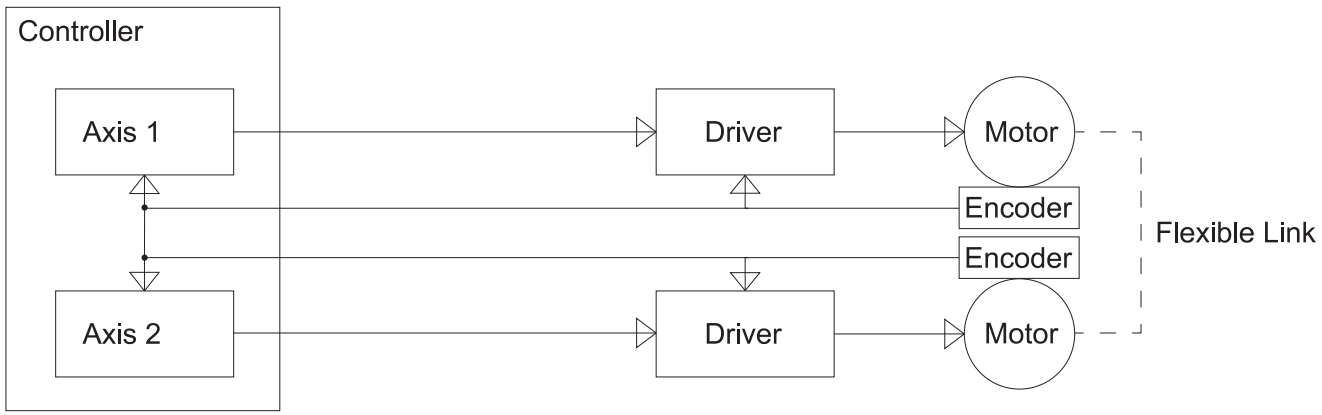


4.4 Active yaw control

With 2 complete sets of motor, encoder, driver and controller axis, it would be better to share both encoder signals among the 2 position loops so that each motor is aware of the actual position of the other motor.

For example, when one motor is slowed down by high friction, the other motor can also slow down to reduce the yaw error. The controller is actively trying to correct the yaw error at all time, hence the name "active yaw control".

Most advanced controllers like Elmo, ACS and Polaris support active yaw control, refer to next section for more description.



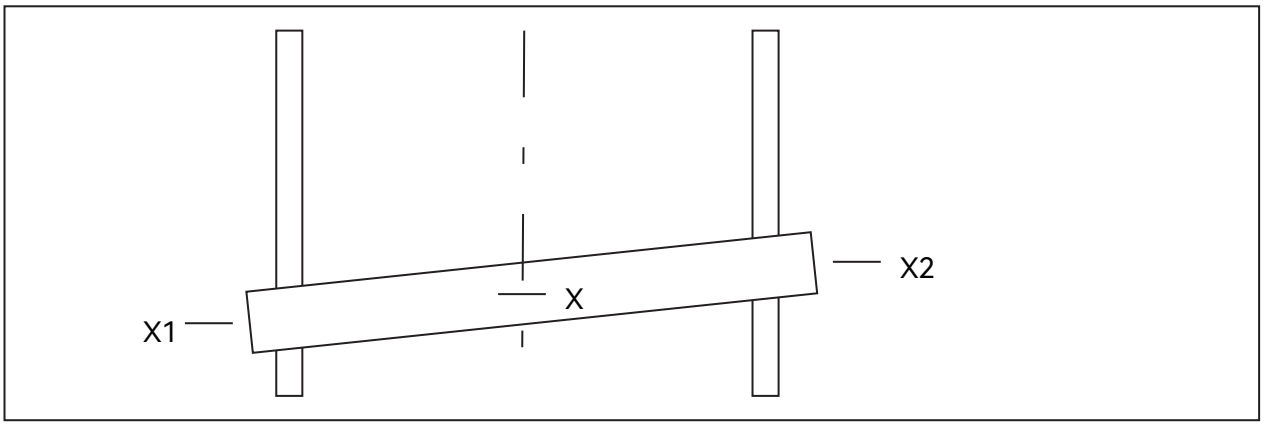
5.Active yaw control

Active yaw control requires 2 sets of motor, encoder, driver and controller axis.

The controller transforms the 2 physical gantry axes (X1 and X2) into gantry main axis (X-axis) and a Yaw-axis based on the following equations.

X = (X1 + X2) / 2

Yaw = X1 - X2



The controller generates motion profile to X axis (which is effectively the desired position at the mid-point of the bridge) while the yaw command should always be zero (that means the bridge is orthogonal to X-axis).

After transforming the X1 and X2 encoder values into X and Yaw's feedback values, the position and velocity control loops (PID, PIP or any other control structure) are processed to output the required current command to X and Yaw axis. These current commands will be transformed back to X1 and X2 axis and send to the current loop of their respective driver.

In this way, X1 and X2 motor will output different force to correct any yaw error while moving the gantry according to the required X-axis profile.

In case of rigid gantry (or less flexible gantry link), it is recommended to set a weak yaw controller by reducing the control gains for Yaw-axis or limit the current command to Yaw-axis. It will be useless (or even harmful) to output strong yaw control to a rigid gantry as the motors will not be able to correct the yaw error due to the rigidity of the gantry.
